

FOI 4205 – Reports of death in people who have been vaccinated with a COVID-19 vaccine

Timeframe between vaccination and death	Percent of reports
Deaths that occurred within 1 week of vaccination	28.3%
Deaths that occurred between 1 and 2 weeks of vaccination	14.3%
Deaths that occurred between 2 and 6 weeks of vaccination	23.3%
Deaths that occurred more than 6 weeks after vaccination	14.9%
Deaths where the timeframe was not reported	20.2%

- Data provided for adverse events with a report date between 1 December 2021 and 31 December 2022, inclusive.
- In cases where an adverse event report includes multiple doses of a COVID-19 vaccine, the time interval between vaccination and death is calculated from the most recently administered COVID-19 vaccine.

Important notes:

Since the beginning of the vaccine rollout to 19 February 2023, almost 65 million doses of COVID-19 vaccines have been given in Australia. The TGA has identified 14 reports where the cause of death was linked to vaccination from 976 reports received and reviewed.

Reporting of a death to the TGA does not mean that the vaccine caused the death or that the reporting doctor/individual considers that it was caused by a vaccine. The TGA strongly encourages consumers and health professionals to report suspected adverse events, even if there is only a very small chance a vaccine was the cause.
