		Dose:	Group 3: 10 µg/BNT162a1/animal		
Death Date:	08/04/2020	Removal Reason:	Killed Terminal		
Necropsy Date:	08/04/2020	Study Day (Week) of Death:	17 (3)		
		Histo Recorder:	s 22		

Gross Pathology Animal Details:

No animal details found

Gross Pathology Observations [Correlation]:

No observations found

Gross Pathology - The following Tissues were Not Examined:

None

Gross Pathology - The following Protocol Required Tissues were Not Processed:

None

Histopathology Animal Details:

No animal details found

Histopathology Observations [Correlation]:

BONE MARROW, OS FEMORIS WITH JOINT : Increased Cellularity; minimal
INJECTION SITE I : intramuscular / interstitial; Fibrosis; mild
INJECTION SITE I : inter- / perimuscular; Fibrosis; mild
INJECTION SITE I : subcutis; Inflammation; mixed, moderate
INJECTION SITE I : intramuscular / interstitial; Inflammation; mixed, moderate
INJECTION SITE I : inter- / perimuscular; Inflammation; mixed, marked
INJECTION SITE I : myofiber; Degeneration; mild
INJECTION SITE I : intramuscular / interstitial; Edema; mild
INJECTION SITE I : inter- / perimuscular; Edema; moderate
KIDNEY, LEFT : Congestion; mild
KIDNEY, RIGHT : Congestion; mild
LIVER : Congestion; mild
LIVER : periportal; Vacuolation; hepatocellular, mild
LYMPH NODE, CERVICAL : Histocytosis; minimal
LYMPH NODE, CERVICAL : germinal center; Increased Cellularity; mild
LYMPH NODE, ILIAC : Plasmacytosis; mild
LYMPH NODE, ILIAC : Inflammation; minimal
LYMPH NODE, ILIAC : germinal center; Increased Cellularity; mild
LYMPH NODE, MESENTERIC : Histocytosis; mild
LYMPH NODE, MESENTERIC : germinal center; Increased Cellularity; mild
STOMACH, GLANDULAR : Infiltration, Eosinophilic; minimal
TRACHEA : Infiltration; mixed, minimal
VAGINA : Keratinization; epithelial, minimal

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology - The following Tissues were Not Examined:

PARATHYROID, RIGHT - Not Present
PEYERS PATCHES - Not Present

Histopathology - The following Protocol Required Tissues were Not Processed:

None

LPT Study No.: 38166 Repeat-Dose Toxicity Study

Individual Animal Data

Animal:	93 (Continued)	Group:	4 - Group 4	Sex:	Male

Histopathology Observations [Correlation] (Continued):

SPLEEN : Congestion; minimal
STOMACH, GLANDULAR : Infiltration, Eosinophilic; mild

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology - The following Tissues were Not Examined:

MAMMARY GLANDS - Not Present
OPTIC NERVE, RIGHT - Not Present
PARATHYROID, LEFT - Not Present
PARATHYROID, RIGHT - Not Present
THYROID, LEFT - Not Present

Histopathology - The following Protocol Required Tissues were Not Processed:

None

Histopathology Animal Details:

No animal details found

Histopathology Observations [Correlation]:

ADRENAL GLAND, LEFT : Dilation; vascular, minimal
BONE MARROW, OS FEMORIS WITH JOINT : Increased Cellularity; minimal
INJECTION SITE I : intramuscular / interstitial; Fibrosis; mild
INJECTION SITE I : inter- / perimuscular; Fibrosis; mild
INJECTION SITE I : subcutis; Inflammation; mixed, moderate
INJECTION SITE I : intramuscular / interstitial; Inflammation; mixed, moderate
INJECTION SITE I : inter- / perimuscular; Inflammation; mixed, moderate
INJECTION SITE I : myofiber; Degeneration; mild
INJECTION SITE I : subcutis; Edema; mild
INJECTION SITE I : intramuscular / interstitial; Edema; mild
INJECTION SITE I : inter- / perimuscular; Edema; mild
INJECTION SITE I : Hyperplasia; epidermal, widespread, mild
INTESTINE, COLON : mucosa-associated lymphoid tissue; Hyperplasia; mild
KIDNEY, LEFT : Congestion; mild
KIDNEY, LEFT : tubule; Basophilia; focal, minimal
KIDNEY, RIGHT : Congestion; mild
LIVER : Congestion; mild
LIVER : Infiltration, Lymphocytic; multifocal, minimal
LUNGS WITH BRONCHI : Hemorrhage; acute, multifocal, minimal
LYMPH NODE, CERVICAL : Histocytosis; minimal
LYMPH NODE, CERVICAL : germinal center; Increased Cellularity; minimal
LYMPH NODE, ILIAC : Histocytosis; mild
LYMPH NODE, ILIAC : germinal center; Increased Cellularity; minimal
LYMPH NODE, MESENTERIC : Histocytosis; moderate
LYMPH NODE, MESENTERIC : germinal center; Increased Cellularity; mild
PEYERS PATCHES : germinal center; Increased Cellularity; moderate
PROSTATE GLAND : Inflammation; purulent, focal, mild
SPLEEN : Congestion; minimal
STOMACH, GLANDULAR : Infiltration, Eosinophilic; minimal

LPT Study No.: 38166 Repeat-Dose Toxicity Study

Individual Animal Data

Animal:	100 (Continued)	Group:	4 - Group 4	Sex:	Male

Histopathology Observations [Correlation] (Continued):

KIDNEY, LEFT : Infiltration, Lymphocytic; multifocal, minimal
KIDNEY, RIGHT : Congestion; moderate
LIVER : Congestion; moderate
LUNGS WITH BRONCHI : bronchial-associated lymphoid tissue; Hyperplasia; minimal
LYMPH NODE, CERVICAL : Histocytosis; minimal
LYMPH NODE, CERVICAL : germinal center; Increased Cellularity; minimal
LYMPH NODE, ILIAC : Plasmacytosis; moderate
LYMPH NODE, ILIAC : germinal center; Increased Cellularity; mild
LYMPH NODE, MESENTERIC : Histocytosis; mild
LYMPH NODE, MESENTERIC : germinal center; Increased Cellularity; mild
SPLEEN : Congestion; minimal
STOMACH, GLANDULAR : Infiltration, Eosinophilic; mild
STOMACH, GLANDULAR : Dilation; glandular, multifocal, minimal
THYMUS : Hemorrhage; acute, focal, mild
TRACHEA : Infiltration; mixed, minimal

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology - The following Tissues were Not Examined:

PARATHYROID, RIGHT - Not Present
PEYERS PATCHES - Not Present

Histopathology - The following Protocol Required Tissues were Not Processed:

None

Histopathology Animal Details:

No animal details found

Histopathology Observations [Correlation]:

CERVIX : Keratinization; epithelial, mild
INJECTION SITE I : intramuscular / interstitial; Fibrosis; minimal
INJECTION SITE I : inter- / perimuscular; Fibrosis; mild
INJECTION SITE I : intramuscular / interstitial; Inflammation; lymphohistiocytic, multifocal, minimal
INJECTION SITE I : inter- / perimuscular; Inflammation; lymphohistiocytic, mild
KIDNEY, RIGHT : Congestion; moderate
LIVER : Congestion; moderate
LUNGS WITH BRONCHI : bronchial-associated lymphoid tissue; Hyperplasia; minimal
LYMPH NODE, CERVICAL : Histocytosis; mild
LYMPH NODE, CERVICAL : germinal center; Increased Cellularity; mild
LYMPH NODE, ILIAC : Histocytosis; mild
LYMPH NODE, ILIAC : germinal center; Increased Cellularity; mild
LYMPH NODE, MESENTERIC : Histocytosis; mild
LYMPH NODE, MESENTERIC : germinal center; Increased Cellularity; mild
PEYERS PATCHES : germinal center; Increased Cellularity; moderate
SPLEEN : Congestion; mild
STOMACH, GLANDULAR : Infiltration, Eosinophilic; minimal
VAGINA : Keratinization; epithelial, mild

Any remaining protocol required tissues, which have been examined, have no visible lesions

Individual Animal Data

Animal:	130 (Continued)	Group:	5 - Group 5	Sex:	Male

Histopathology Observations [Correlation] (Continued):

INJECTION SITE II : intramuscular / interstitial; Fibrosis; mild [INJECTION SITE II : Indurated : (Comment) muscle (G)]
INJECTION SITE II : inter- / perimuscular; Fibrosis; mild [INJECTION SITE II : Indurated : (Comment) muscle (G)]
INJECTION SITE II : subcutis; Inflammation; mixed, moderate [INJECTION SITE II : Indurated : (Comment) muscle (G)]
INJECTION SITE II : intramuscular / interstitial; Inflammation; mixed, multifocal, moderate [INJECTION SITE II : Indurated : (Comment) muscle (G)]
INJECTION SITE II : inter- / perimuscular; Inflammation; mixed, moderate [INJECTION SITE II : Indurated : (Comment) muscle (G)]
KIDNEY, LEFT : Congestion; moderate
KIDNEY, RIGHT : Congestion; moderate
LIVER : Congestion; moderate
LIVER : Hematopoiesis; extramedullary, multifocal, minimal
LIVER : periportal; Vacuolation; hepatocellular, minimal
LUNGS WITH BRONCHI : bronchial-associated lymphoid tissue; Hyperplasia; minimal
LYMPH NODE, CERVICAL : Histocytosis; mild
LYMPH NODE, CERVICAL : germinal center; Increased Cellularity; mild
LYMPH NODE, ILIAC : Histocytosis; mild
LYMPH NODE, ILIAC : Plasmacytosis; mild [LYMPH NODE, ILIAC : Enlarged (G)]
LYMPH NODE, ILIAC : germinal center; Increased Cellularity; moderate [LYMPH NODE, ILIAC : Enlarged (G)]
LYMPH NODE, MESENTERIC : Histocytosis; mild
LYMPH NODE, MESENTERIC : germinal center; Increased Cellularity; mild
NERVE, SCIATIC : perineural; Inflammation; mild
PEYERS PATCHES : germinal center; Increased Cellularity; moderate
SPLEEN : Congestion; minimal
STOMACH, GLANDULAR : Infiltration, Eosinophilic; minimal

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology - The following Tissues were Not Examined:

PARATHYROID, RIGHT - Not Present

LPT Study No.: 38166 Repeat-Dose Toxicity Study

Individual Animal Data

Animal:	142 (Continued)	Group:	5 - Group 5	Sex:	Female

Histopathology Observations [Correlation] (Continued):

INJECTION SITE II : inter- / perimuscular; Edema; moderate [INJECTION SITE II : Thickened (G)]
INJECTION SITE II : intramuscular / interstitial; Fibrosis; mild [INJECTION SITE II : Thickened (G)]
INJECTION SITE II : inter- / perimuscular; Fibrosis; mild [INJECTION SITE II : Thickened (G)]
INJECTION SITE II : subcutis; Inflammation; mixed, moderate [INJECTION SITE II : Thickened (G)]
INJECTION SITE II : intramuscular / interstitial; Inflammation; mixed, mild [INJECTION SITE II : Thickened (G)]
INJECTION SITE II : inter- / perimuscular; Inflammation; mixed, moderate [INJECTION SITE II : Thickened (G)]
INTESTINE, CECUM : Infiltration, Eosinophilic; increased, minimal
KIDNEY, LEFT : Congestion; moderate
KIDNEY, RIGHT : Congestion; moderate
LIVER : Congestion; moderate
LIVER : Hematopoiesis; extramedullary, multifocal, minimal
LIVER : periportal; Vacuolation; hepatocellular, mild
LUNGS WITH BRONCHI : Ossification; focal, minimal
LYMPH NODE, CERVICAL : Histocytosis; mild
LYMPH NODE, CERVICAL : germinal center; Increased Cellularity; mild
LYMPH NODE, ILIAC : Histocytosis; mild [LYMPH NODE, ILIAC : Enlarged (G)]
LYMPH NODE, ILIAC : Plasmacytosis; moderate [LYMPH NODE, ILIAC : Enlarged (G)]
LYMPH NODE, ILIAC : Inflammation; minimal
LYMPH NODE, ILIAC : germinal center; Increased Cellularity; moderate [LYMPH NODE, ILIAC : Enlarged (G)]
LYMPH NODE, MESENTERIC : Histocytosis; minimal
LYMPH NODE, MESENTERIC : germinal center; Increased Cellularity; mild
NERVE, SCIATIC : perineural; Inflammation; moderate [NERVE, SCIATIC : Adhesion : (Comment) to injection site I (G)]
SKIN : dermis; subcutis; Infiltration; mixed, mild
SPLEEN : Congestion; minimal
SPLEEN : Hematopoiesis; increased, minimal [SPLEEN : Enlarged (G)]
STOMACH, GLANDULAR : Infiltration, Eosinophilic; minimal
THYROID, LEFT : Cyst; keratinized, single, minimal
VAGINA : Keratinization; epithelial, minimal

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology - The following Tissues were Not Examined:

PARATHYROID, RIGHT - Not Present
PEYERS PATCHES - Not Present

Histopathology - The following Protocol Required Tissues were Not Processed:

None

Histopathology Observations [Correlation]:

KIDNEY, LEFT : Congestion; moderate
KIDNEY, RIGHT : Congestion; moderate
LIVER : Congestion; moderate
LIVER : Infiltration; mixed, focal, minimal
LIVER : Infiltration, Lymphocytic; multifocal, minimal
LYMPH NODE, CERVICAL : Histocytosis; minimal
LYMPH NODE, CERVICAL : germinal center; Increased Cellularity; mild
LYMPH NODE, ILIAC : Histocytosis; mild
LYMPH NODE, ILIAC : Infiltration; macrophage, multifocal, minimal
LYMPH NODE, ILIAC : germinal center; Increased Cellularity; minimal
LYMPH NODE, MESENTERIC : Histocytosis; minimal
LYMPH NODE, MESENTERIC : germinal center; Increased Cellularity; mild
SPLEEN : Congestion; mild
STOMACH, GLANDULAR : Infiltration, Eosinophilic; minimal
THYMUS : Hemorrhage; acute, focal, minimal
THYROID, RIGHT : Cyst; keratinized, single, minimal
TONGUE : Granuloma; single, minimal

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology - The following Tissues were Not Examined:

PARATHYROID, LEFT - Not Present
PEYERS PATCHES - Not Present

Histopathology - The following Protocol Required Tissues were Not Processed:

None

Histopathology Observations [Correlation] (Continued):

LYMPH NODE, CERVICAL : germinal center; Increased Cellularity; moderate
LYMPH NODE, ILIAC : Histocytosis; mild
LYMPH NODE, ILIAC : Plasmacytosis; mild
LYMPH NODE, ILIAC : Inflammation; mild
LYMPH NODE, ILIAC : germinal center; Increased Cellularity; mild
LYMPH NODE, MESENTERIC : Histocytosis; mild
LYMPH NODE, MESENTERIC : germinal center; Increased Cellularity; mild
SKELETAL MUSCLE : Infiltration; mixed, focal, minimal
NERVE, SCIATIC : perineural; Inflammation; moderate
PEYERS PATCHES : germinal center; Increased Cellularity; mild
PITUITARY GLAND : pars distalis; Cyst; few, minimal
STOMACH, GLANDULAR : Infiltration, Eosinophilic; minimal
STOMACH, GLANDULAR : mucosa-associated lymphoid tissue; Hyperplasia; mild
TRACHEA : (Comment) artefacts

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology - The following Tissues were Not Examined:

PARATHYROID, LEFT - Not Present
PARATHYROID, RIGHT - Not Present

Histopathology - The following Protocol Required Tissues were Not Processed:

None

LPT Study No.: 38166 Repeat-Dose Toxicity Study

Individual Animal Data

Animal:	199	Group:	7 - Group 7	Sex:	Female
		Dose:	Group 7: 100 µg/BNT162b2/animal		
Death Date:	08/04/2020	Removal Reason:	Killed Terminal		
Necropsy Date:	08/04/2020	Study Day (Week) of Death:	17 (3)		
		Histo Recorder:	s 22		

Gross Pathology Animal Details:

No animal details found

Gross Pathology Observations [Correlation]:

INJECTION SITE I : Indurated (TGL) [INJECTION SITE I : subcutis; Inflammation; mixed, moderate (H) | INJECTION SITE I : inter- / perimuscular; Inflammation; mixed, moderate (H) | INJECTION SITE I : intramuscular / interstitial; Inflammation; mixed, mild (H) | INJECTION SITE I : inter- / perimuscular; Fibrosis; mild (H) | INJECTION SITE I : subcutis; Edema; mild (H) | INJECTION SITE I : inter- / perimuscular; Edema; moderate (H) | INJECTION SITE I : intramuscular / interstitial; Edema; mild (H)]

LYMPH NODE, ILIAC : Enlarged (TGL) [LYMPH NODE, ILIAC : Plasmacytosis; moderate (H) | LYMPH NODE, ILIAC : germinal center; Increased Cellularity; mild (H)]

SPLEEN : Enlarged (TGL) [SPLEEN : Hematopoiesis; increased, minimal (H)]

UTERUS : Dilation (TGL) [UTERUS : Dilation; mild (H)]

UTERUS : Filled With Liquid : (Comment) clear (TGL) [UTERUS : Dilation; mild (H)]

INJECTION SITE II : Indurated : (Comment) muscle (TGL) [INJECTION SITE II : subcutis; Inflammation; mixed, moderate (H) | INJECTION SITE II : inter- / perimuscular; Inflammation; mixed, moderate (H) | INJECTION SITE II : intramuscular / interstitial; Inflammation; mixed, mild (H) | INJECTION SITE I : intramuscular / interstitial; Fibrosis; mild (H) | INJECTION SITE II : inter- / perimuscular; Fibrosis; mild (H) | INJECTION SITE II : intramuscular / interstitial; Fibrosis; mild (H) | INJECTION SITE II : intramuscular / interstitial; Edema; mild (H) | INJECTION SITE II : subcutis; Edema; mild (H) | INJECTION SITE II : inter- / perimuscular; Edema; moderate (H)]

Gross Pathology - The following Tissues were Not Examined:

None

Gross Pathology - The following Protocol Required Tissues were Not Processed:

None

Histopathology Animal Details:

No animal details found

Histopathology Observations [Correlation]:

BONE, OS FEMORIS WITH JOINT : surrounding tissue; Inflammation; mixed, mild
BONE MARROW, OS FEMORIS WITH JOINT : Increased Cellularity; minimal
CERVIX : Keratinization; epithelial, mild
HARDERIAN GLAND, RIGHT : Infiltration; mixed, focal, mild
INJECTION SITE I : intramuscular / interstitial; Fibrosis; mild [INJECTION SITE II : Indurated (G)]
INJECTION SITE I : inter- / perimuscular; Fibrosis; mild [INJECTION SITE I : Indurated (G)]
INJECTION SITE I : subcutis; Inflammation; mixed, moderate [INJECTION SITE I : Indurated (G)]
INJECTION SITE I : intramuscular / interstitial; Inflammation; mixed, mild [INJECTION SITE I : Indurated (G)]
INJECTION SITE I : inter- / perimuscular; Inflammation; mixed, moderate [INJECTION SITE I : Indurated (G)]
INJECTION SITE I : myofiber; Degeneration; mild
INJECTION SITE I : subcutis; Edema; mild [INJECTION SITE I : Indurated (G)]
INJECTION SITE I : intramuscular / interstitial; Edema; mild [INJECTION SITE I : Indurated (G)]
INJECTION SITE I : inter- / perimuscular; Edema; moderate [INJECTION SITE I : Indurated (G)]
INJECTION SITE I : Hyperplasia; epidermal, widespread, mild
INJECTION SITE II : myofiber; Degeneration; mild
INJECTION SITE II : Hyperplasia; epidermal, widespread, moderate

Individual Animal Data

Animal:	199 (Continued)	Group:	7 - Group 7	Sex:	Female

Histopathology Observations [Correlation] (Continued):

INJECTION SITE II : subcutis; Edema; mild [INJECTION SITE II : Indurated (G)]
INJECTION SITE II : intramuscular / interstitial; Edema; mild [INJECTION SITE II : Indurated (G)]
INJECTION SITE II : inter- / perimuscular; Edema; moderate [INJECTION SITE II : Indurated (G)]
INJECTION SITE II : intramuscular / interstitial; Fibrosis; mild [INJECTION SITE II : Indurated (G)]
INJECTION SITE II : inter- / perimuscular; Fibrosis; mild [INJECTION SITE II : Indurated (G)]
INJECTION SITE II : subcutis; Inflammation; mixed, moderate [INJECTION SITE II : Indurated (G)]
INJECTION SITE II : intramuscular / interstitial; Inflammation; mixed, mild [INJECTION SITE II : Indurated (G)]
INJECTION SITE II : inter- / perimuscular; Inflammation; mixed, moderate [INJECTION SITE II : Indurated (G)]
INTESTINE, RECTUM : Infiltration, Eosinophilic; increased, minimal
KIDNEY, LEFT : Congestion; moderate
KIDNEY, RIGHT : Congestion; moderate
LIVER : Congestion; moderate
LIVER : Hematopoiesis; extramedullary, multifocal, minimal
LIVER : periportal; Vacuolation; hepatocellular, mild
LUNGS WITH BRONCHI : bronchial-associated lymphoid tissue; Hyperplasia; minimal
LUNGS WITH BRONCHI : perivascular; Infiltration, Eosinophilic; multifocal, minimal
LYMPH NODE, CERVICAL : Histocytosis; minimal
LYMPH NODE, CERVICAL : germinal center; Increased Cellularity; mild
LYMPH NODE, ILIAC : Histocytosis; minimal
LYMPH NODE, ILIAC : Plasmacytosis; moderate [LYMPH NODE, ILIAC : Enlarged (G)]
LYMPH NODE, ILIAC : Inflammation; mild
LYMPH NODE, ILIAC : germinal center; Increased Cellularity; mild [LYMPH NODE, ILIAC : Enlarged (G)]
LYMPH NODE, MESENTERIC : Histocytosis; mild
LYMPH NODE, MESENTERIC : germinal center; Increased Cellularity; mild
NERVE, SCIATIC : perineural; Inflammation; moderate
PEYERS PATCHES : germinal center; Increased Cellularity; mild
SKIN : dermis; subcutis; Infiltration; mixed, focal, minimal
SPLEEN : Congestion; minimal
SPLEEN : Hematopoiesis; increased, minimal [SPLEEN : Enlarged (G)]
STOMACH, GLANDULAR : Infiltration, Eosinophilic; minimal
UTERUS : Dilation; mild [UTERUS : Dilation (G) | UTERUS : Filled With Liquid : (Comment) clear (G)]
VAGINA : Keratinization; epithelial, mild

Any remaining protocol required tissues, which have been examined, have no visible lesions

1 SUMMARY

BioNTech is developing RNA-based vaccines designed to protect against the novel coronavirus disease that emerged in 2019 (COVID-19). The project involves testing three RNA platforms which are under development at BioNTech with domains of the surface or spike protein (S protein) of the novel Coronavirus (SARS-CoV-2) as the viral antigen.

In the present accessory study to the GLP-compliant repeat-dose toxicity study in rats (LPT Study No. 38166), the immunogenicity of the administered SARS-CoV-2-S protein targeted RNA vaccines BNT162a1, BNT162b1, BNT162b2, and BNT162c1 was investigated. Serum samples were collected from (i) the treated main study animals at day 10 (BNT162c1) or at day 17 after first immunization (BNT162a1, BNT162b1, and BNT162b2) as well as (ii) the treated recovery cohorts at day 31 (BNT162c1) or at day 38 (BNT162a1, BNT162b1, and BNT162b2). The elicited antibody immune responses were analyzed by S1 domain and RBD sub-domain specific ELISA as well as VSV/SARS-CoV-2-S-based pseudovirus neutralization assay (pVNT).

The recorded data demonstrates that all BNT162 vaccine candidates elicited a SARS-CoV-2-S protein specific antibody response directed against the S1 domain and the RBD sub-domain. The antibody response induced by the BNT162c1 vaccine was low in extent and did not confer neutralization activity in most animals. The development of the BNT162c1 candidate was discontinued. For BNT162a1, BNT162b1 and BNT162b2 vaccines, antibody responses detected via ELISA increased over time and directly translated into neutralizing activity as seen in the VSV/SARS-CoV-2-S pseudovirus neutralization test. For those vaccine candidates, sera from animals with higher antigen-specific antibody titers also displayed more pronounced virus neutralization effect and, in case of modRNA based vaccines, BNT162b1 and BNT162b2, exceeded the upper limit of quantification of the assay.

3 INTRODUCTION

3.1 Background

In December 2019, an outbreak of pneumonia of unknown cause in Wuhan, Hubei province in China started. The disease spread rapidly and in January 2020, the agent was identified. By June 9th 2020, infection with the novel Coronavirus (SARS-CoV-2) was confirmed in approximately 7,000,000 people with more than 400,000 casualties[1]. A vaccine is urgently needed and BioNTech decided to develop a rapid vaccine project based on the surface or spike protein (S protein) of the virus as the viral antigen. The S protein is a trimer and during viral egress, the precursor protein is cleaved into S1 and S2 subunits (Figure 1). While the S1 domain recognizes the host receptor, the S2 domain is essential for the membrane fusion of the viral envelope and the endosomal membrane. To initiate membrane fusion, the S2 domain undergoes a conformational change within the central helix domain.

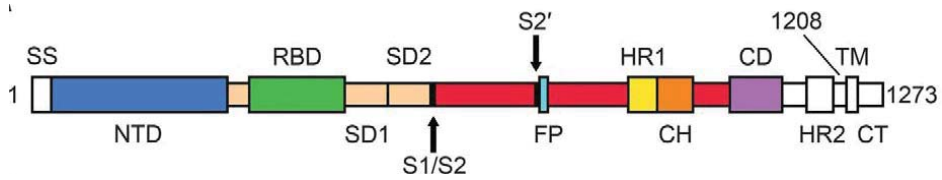

Figure 1: Schematic overview of the protein organization of the SARS-CoV-2 S protein
The sequence within the S1 subunit consists of the signal sequence (SS) and the receptor binding domain (RBD) which is the key subunit within the S protein which is relevant for binding to the human cellular receptor ACE2. The S2 subunit contains the S2 protease cleavage site (S2') followed by a fusion peptide (FP) for membrane fusion, heptad repeats (HR1 and HR2) with a central helix (CH) domain, the transmembrane domain (TM) and a cytoplasmic tail (CT); source: modified from (Wrapp et al. 2020).

Based on these features, the S protein is the prime target for vaccine development with a vaccine potentially eliciting neutralizing antibodies (nAb) that bind dominantly to the receptor-binding domain (RBD) of the S protein. Vaccine candidates selected for nonclinical testing include the following vaccine antigens:

- A secreted variant of the RBD of the SARS CoV-2 S-protein (vaccine candidate is called V5) (Kirchdoerfer et al. 2018)
- Membrane-tethered full-length S protein with two point mutations within the central helix domain. Mutation of the two amino acids to proline, (KV286-287PP) retains the S protein in an antigenically optimal prefusion conformation (vaccine candidate is called V8/V9 depending on the codon optimization used in the RNA) (Wrapp et al. 2020, Pallesen et al. 2017)

The development of *in vitro* transcribed RNA as an active platform for the use in infectious disease vaccines is based on the extensive knowledge of the company in RNA technology, which has been gained over the last decade. The core innovation is based on *in vivo* delivery of a pharmacologically optimized, antigen-coding RNA vaccine to induce robust nAbs and concomitant T-cell responses to achieve protective immunization with minimal vaccine doses (Vogel at al. 2017, Moyo et al. 2018, Pardi et al. 2017).

At BioNTech, there are three different RNA platforms under development, namely non-modified uridine-containing mRNA (uRNA), nucleoside-modified mRNA (modRNA) and self-amplifying RNA (saRNA). It is unknown today which RNA vaccine platform performs best in terms of activation and duration of a potent immune response. Therefore, BioNTech has developed a project plan evaluating the immune response of SARS-Co-V-2 vaccines based on all three platforms. The three vaccine platforms are currently tested for each antigen construct in non-clinical mouse studies to dissect the induced immunogenicity. Moreover, a GLP-compliant repeat-dose toxicity study was conducted to characterize the safety profile of each RNA platform and to assess to which extent any observed side effect is specific to the RNA platform, the vaccine dose and/or the encoded antigen. This report covers an accessory study to the REPEAT-DOSE TOXICITY STUDY OF THREE LNP-FORMULATED RNA PLATFORMS ENCODING FOR VIRAL PROTEINS BY REPEATED INTRAMUSCULAR ADMINISTRATION TO WISTAR HAN RATS (LPT Study No. 38166) assessing the vaccine-induced immunogenicity seen in rats.

3.2 Objectives

The objective of this accessory study to the GLP-compliant repeat-dose toxicity study in rats (LPT Study No. 38166) was to obtain information on the immunogenicity of the administered SARS-CoV-2-S protein targeted RNA vaccines BNT162a1, BNT162b1, BNT162b2 and BNT162c1 in the rats. The elicited antibody immune response directed against the S1 domain and the RBD sub-domain was analyzed by enzyme-linked immunosorbent assay (ELISA), and the neutralizing capacity of antibodies assessed via pseudovirus neutralization test (pVNT).

3.3 Study Design

In order to obtain information on the SARS-CoV-2-S specific antibody responses induced in the GLP-compliant repeat-dose toxicity study in rats (LPT Study No. 38166), serum samples were collected from the treated main study animals at day 10 (BNT162c1) or at day 17 after first immunization (BNT162a1, BNT162b1, and BNT162b2) as well as from the treated recovery cohorts at day 31 (BNT162c1) or at day 38 (BNT162a1, BNT162b1, and BNT162b2). The corresponding study design of the *in vivo* study is summarized in Table 1. The elicited antibody immune response was analyzed by S1 domain and RBD sub-domain specific ELISA and VSV/SARS-CoV-2-S-based pVNT.

4 MATERIALS AND METHODS

4.1 Test Item

Table 2: Test serum derived from the GLP-compliant repeat-dose toxicity study (Study No. 38166).

Rat serum	Treatment and dose level	Time-point of serum generation
Group 2 (main study) (animals 31-40, 46-55)	30 µg/animal BNT162a1	Day 17
Group 2 (recovery cohort) (animals 41-45, 56-60)		Day 38
Group 3 (main study) (animals 61-70, 76-85)	10 µg/animal BNT162a1	Day 17
Group 3 (recovery cohort) (animals 71-75, 86-90)		Day 38
Group 4 (main study) (animals 91-100, 106-115)	30 µg/animal BNT162b1	Day 17
Group 4 (recovery cohort) (animals 101-105, 116-120)		Day 38
Group 5 (main study) (animals 121-130, 136-145)	100 µg/animal BNT162b1	Day 17
Group 5 (recovery cohort (animals 131-135, 146-150)		Day 38
Group 6 (main study) (animals 151-160, 166-175)	30 µg/animal BNT162c1	Day 10
Group 6 (recovery cohort) (animals 161-165, 176-180)		Day 31
Group 7 (main study) (animals 181-190, 196-205)	100 µg/animal BNT162b2	Day 17
Group 7 (recovery cohort) (animals 191-195, 206-210)		Day 38

4.2 Control Item

Table 3: Control serum derived from the GLP-compliant repeat-dose toxicity study (Study No. 38166).

Rat serum	Treatment and dose level	Time-point of serum generation
Group 1 (main study) (animals 1-10, 16-25)	Vehicle buffer control (PBS/300 mM sucrose)	Day 17
Group 1 (recovery cohort) (animals 11-15, 26-30)		Day 38

4.3 Test System

- Recombinant His-tagged SARS-CoV-2-S spike protein S1 domain coated in high-protein binding 96-well plate

4.5 Methods

4.5.1 ELISA

Serum samples were tested in 96-well plates for their S-specific antibody concentration based on SOP-030-112 (with minor modifications as described below). Briefly, for the time points 10 days (BNT162c1) or 17 days (BNT162a1, BNT162b1 and BNT162b2, see Section 4.1) after immunization, a screening analysis was performed.

1. Coat each well of a MaxiSorp plate with 100 ng recombinant protein (SARS-CoV2 S1 subunit or RBD) per well in 100 µL coating buffer (50 mM sodium carbonate buffer [1.696 g Na_2CO_3 + 2.856 g $NaHCO_3$ ad 1 L Aqua dest.], pH 9.6)
2. Cover plates and incubate at 4°C o/n.
3. Wash three times with 300 µL/well PBS-T (9 L Aqua dest. + 1 L 10x PBS + 1 mL Tween 20).
4. Block all wells with 250 µL/well blocking buffer (900 mL Aqua dest. + 100 mL 10x Casein Blocking Buffer)
5. Incubate at 37°C for 1 h on shaker.
6. Wash three times with 300 µL/well PBS-T.
7. Dilute primary antibodies (samples and positive control) according to schedule.
8. Incubate at 37°C for 1 h on shaker.
9. Wash three times with 300 µL/well PBS-T.

090177e194f4cf37\Approved\Approved On: 18-Sep-2020 13:38 (GMT)

10. Dilute the secondary antibodies according to calculations.
11. Incubate at 37°C for 45 min on shaker.
12. Wash three times with 300 µL/well PBS-T.
13. Add 100 µL/well TMB substrate.
14. Incubate 8 min at RT (clear->blue).
15. Stop the reaction with 100 µL 25% sulfuric acid (blue -> yellow).
16. Read on plate reader (450 nm, reference: 620 nm).

4.5.2 Production of SARS-CoV2-S pseudotyped VSV vector

Replication-deficient vesicular stomatitis virus (VSV) that lacks the genetic information for the VSV envelope glycoprotein VSV-G but contains an open-reading frame (ORF) for green fluorescent protein (GFP) was used for SARS-CoV-2-S pseudovirus generation. VSV pseudotypes were generated according to a published protocol (Hoffmann et al. 2020).

In brief, HEK293T/17 cells cultured in DMEM supplemented with 10% FBS were transfected with a pcDNA3.1-derived expression plasmid coding for the SARS-CoV-2 spike protein (GenBank ID: QHD43416.1) with shortened cytoplasmatic tail, i.e. pSARS-CoV-2-S-CΔ19, using Lipofectamine® LTX & PLUS™ Reagent following the manufacturer's instructions. The cytoplasmatic tail was truncated for the 19 C-terminal amino acids to facilitate a more efficient integration of SARS-CoV-2-S into VSV virions analogous to SARS-CoV-S pseudotyped VSV (Fukushi et al. 2005). At 24 h post transfection, cells were inoculated with VSV-G transcomplemented VSV-ΔG-GFP vector (Indiana strain, *de novo* generated by reverse genetics from plasmid (Lawson et al. 1995)) at a multiplicity of infection (MOI) of three and incubated for 2 h at 37°C and 5% CO2. Next, the inoculum was removed, cells were washed with phosphate-buffered saline (DPBS), and standard culture medium, which contained 0.5 µg/mL anti-VSV-G antibody, was added to neutralize residual input virus. Twenty-four hours after infection, VSV/SARS-CoV-2-S pseudovirus-containing supernatants were harvested, filtered and stored at -80 °C in aliquots until further use.

4.5.3 Titration of VSV/SARS-CoV2 pseudovirus

For titration of VSV/SARS CoV-2-S pseudovirus, Vero-76 cells were thawed according to SOP-030-041, diluted to 2.67×105 cells/mL in assay medium (DMEM/10% FBS) and seeded in 96-well flat-bottom plates at 4 × 10^4 cells per well. Cells were incubated for 4 to 6 hours at 37 °C and 7.5% CO2. Meanwhile, two-fold, eight-step serial dilutions were prepared in 96-well V-bottom plates beginning with undiluted pseudovirus supernatant. Vero-76 wells were inoculated with 50 µl of the diluted pseudovirus supernatant and incubated for 16 to 24 hours at 37 °C and 7.5% CO2. Each dilution was tested in duplicate wells. After the incubation, the cell culture plates were removed from the incubator, placed in an IncuCyte Live Cell Analysis system and equilibrated for 30 minutes prior to the analysis. Whole well scanning for brightfield and GFP fluorescence was performed using a 4× objective. The number of infected GFP-

090177e194f4cf37\Approved\Approved On: 18-Sep-2020 13:38 (GMT)

fluorescent cells per well was plotted as a function of pseudovirus supernatant dilution using GraphPad Prism v8. Data were fitted and the fitting equation used to calculate the amount of viral supernatant needed to obtain 144 infected cells/96-well (20% excess for virus neutralization test included; see Section 4.5.4).

4.5.4 Pseudovirus Neutralization Test

For analyzing the amount of nAbs in the serum samples, sera collected at 10 days (BNT162c1) or 17 days (BNT162a1, BNT162b1 and BNT162b2, see Section 4.1) after immunization were tested using the VSV/SARS-CoV-2-S pseudovirus neutralization test (pVNT). For the pVNT assay, Vero-76 cells were thawed according to SOP-030-041, diluted to 2.67×105 cells/mL in assay medium (DMEM/10% FBS) and seeded in 96-well flat-bottom plates at 4×10^4 cells per well. Cells were incubated for 4 to 6 hours at 37 °C and 7.5% CO2. Initial dilutions of rat serum samples were prepared by adding 10 µL of serum to 50 µL assay medium in a 96-well V-bottom plate. Seven additional dilutions were subsequently prepared in two-fold dilution steps, by iteratively transferring 30 µL of diluted sera to wells containing 30 µL assay medium. VSV/SARS-CoV-2 pseudovirus was thawed and diluted to obtain 120 infected cells/25 µL (4.8×10^3 infectious units [IU]/mL). 30 µL of diluted pseudovirus (corresponds to 144 infected cells; see Section 4.5.3) was added to the wells containing the serum dilution series. The pseudovirus/serum dilution mix was incubated for 5 minutes at room temperature (RT) on a Heidolph Titramax 100 microplate shaker at 750 rpm, and additional 5 min at RT without agitation. The pseudovirus/serum dilution mix was then added to the seeded Vero-76 cells (50 µL mix per well, MOI: 0.003), followed by incubation for 16 to 24 hours at 37 °C and 7.5% CO_2. Each dilution of serum samples was tested in duplicate wells. Vero-76 cells incubated with pseudovirus in the absence of rat sera were used as positive controls. Vero-76 cells incubated without pseudovirus were used as negative controls. After the incubation, the cell culture plates were removed from the incubator, placed in an IncuCyte Live Cell Analysis system and equilibrated for 30 minutes prior to the analysis. Whole well scanning for brightfield and GFP fluorescence was performed using a 4× objective. To calculate the neutralizing titer, infected GFP-positive cell number per well was compared with the no-serum pseudovirus positive control. Mean values of the no-serum pseudovirus positive control multiplied by 0.5 represents the pseudovirus neutralization 50% (pVN50); mean values of the no-serum pseudovirus positive control multiplied by 0.1 represents the pseudovirus neutralization 90%. Serum samples with mean values below this cut-off exhibit >50% or >90% virus neutralization activity, respectively.

5 RESULTS

The exposure of rats to the four different BNT162 vaccine candidates was evaluated via SARS-CoV-2 spike protein specific antibody responses in an accessory study to the REPEAT-DOSE TOXICITY STUDY OF THREE LNP-FORMULATED RNA PLATFORMS ENCODING FOR VIRAL PROTEINS BY REPEATED INTRAMUSCULAR ADMINISTRATION TO WISTAR HAN RATS (LPT Study No. 38166). In this toxicity study rats were injected intramuscularly with different dose levels of BNT162a1, BNT162b1 or a single dose level of BNT162b2 or BNT162c1. Table 6 summarizes the treatment groups.

Table 6: Overview of treatment groups in LPT study no. 38166

Treatment group	Dose level / product	RNA platform	Antigen	Translated Protein
1			Vehicle Buffer Control	
2	30 µg BNT162a1	uRNA	V5	Secreted RBD variant with a C-terminal trimerization domain
3	10 µg BNT162a1			
4	30 µg BNT162b1	modRNA	V5	Secreted RBD variant with a C-terminal trimerization domain
5	100 µg BNT162b1			
6	30 µg BNT162c1	saRNA	V5	Secreted RBD variant with a C-terminal trimerization domain
7	100 µg BNT162b2	modRNA	V8	Membrane tethered, mutated full-length S protein

Whereas uRNA and modRNA based vaccines were administered three times one week apart (days 1, 8, 15), the saRNA based vaccine was administered only twice with one week apart (days 1, 8). The capacity of the RNA-encoded antigens to induce antibody responses was studied using ELISA and pVNT assay.

5.1 ELISA

Induced antibody responses directed against the SARS-CoV-2 spike protein S1 domain and RBD sub-domain were assessed at day 10 after two immunization rounds (BNT162c1) or day 17 after three rounds of immunization (BNT162a1, BNT162b1, and BNT162b2; Table 6), as well as from the treated recovery cohorts at day 31 (BNT162c1) or at day 38 (BNT162a1, BNT162b1, and BNT162b2). Due to the unknown strength of the elicited immune response, different dilutions of rat serum ranging from 1:100 to 1:24,300 were tested as part of an ELISA screening analysis.

Treatment of rats with each of the BNT162 vaccine candidates resulted in the formation of antibodies of the IgG isotype against the S1 domain as well as the RBD sub-domain of the SARS-CoV-2 spike protein, while these antibodies were not detected in samples

090177e194f4cf37\Approved\Approved On: 18-Sep-2020 13:38 (GMT)

from vehicle buffer control treated animals (Figure 2, Figure 3, Figure 4 and Figure 5). The analysis showed a weak antibody immune response for BNT162c1 treated animals at day 10 and day 31, a moderate antibody immune response for BNT162a1 treated animals at day 17 and day 38, and a strong antibody immune response for both modRNA based vaccines, BNT162b1 and BNT162b2, at day 17 and day 38, irrespective of the vaccine antigen used. Whereas for the BNT162b1 cohort the magnitude of immune activation was dose-dependent, the low-dose (10 µg/animal) BNT162a1 treated animals displayed a slightly more pronounced antibody immune response with higher titers of antigen-specific IgG in serum compared to the high-dose (30 µg/animal) treated cohort.

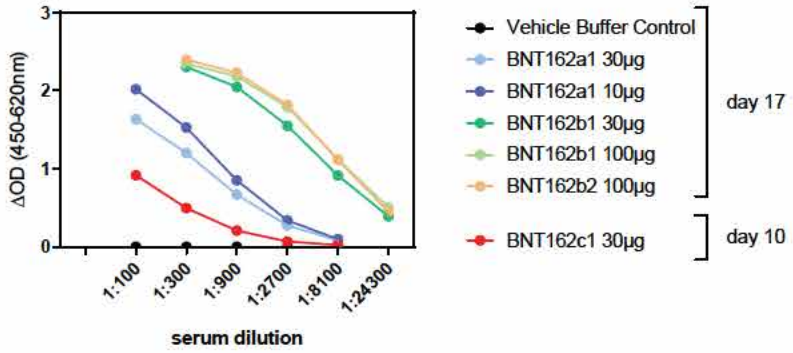

Figure 2: ELISA screening analysis of main study cohort sera to detect antibody responses directed against the recombinant SARS-CoV-2 spike protein S1 domain

ELISA was performed using serum samples collected on day 10 after two immunizations (prime/boost on days 1 and 8) with BNT162c1, or on day 17 after three administrations (prime/boost on days 1/8/15) of BNT162a1, BNT162b1, or BNT162b2 to analyze elicited antibody responses. The serum samples were tested against the S1 protein. Group mean ΔOD values of n=20 mice/group are shown by dots across serum dilutions ranging from 1:100 to 1:24,300.

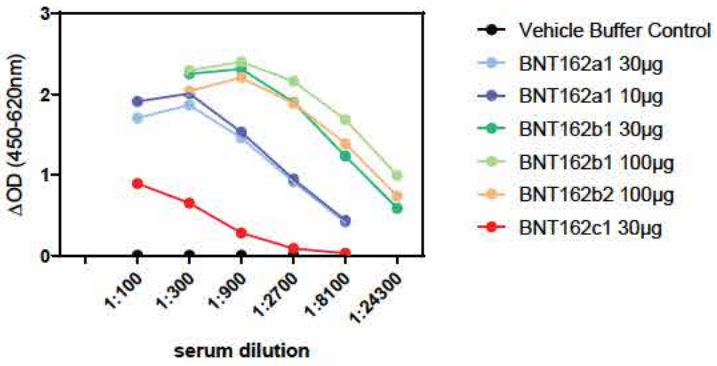

Figure 5: ELISA screening analysis of recovery cohort sera to detect antibody responses directed against the recombinant SARS-CoV-2 spike protein RBD domain

ELISA was performed using serum samples collected on day 31 after two immunizations (prime/boost on days 1 and 8) with BNT162c1, or on day 38 after three administrations (prime/boost on days 1/8/15) of BNT162a1, BNT162b1, or BNT162b2 to analyze elicited antibody responses. The serum samples were tested against the RBD domain. Group mean ΔOD values of n=20 rats/group are shown by dots across serum dilutions ranging from 1:100 to 1:24,300.

5.2 Pseudovirus-based Neutralization Test

To functionally characterize the elicited SARS-CoV-2 spike protein specific antibody response in rats, the neutralizing capacity of sera was assessed employing a VSV/SARS-CoV-2-S pseudovirus system in conjunction with Vero 76 cells as target. Vero 76 cell express endogenous angiotensin-converting enzyme 2 (ACE2), the identified entry receptor for SARS-CoV-2 (Hoffmann et al. 2020). Sera of ten representative animals per cohort and time-point (generated from n=5 male and n=5 female rats) were analyzed.

Treatment of rats with each of the BNT162 vaccine candidates resulted in the formation of neutralizing antibodies protecting Vero 76 cells against pseudovirus infection (titer resulting in 50% pseudovirus neutralization in Figure 6 and Figure 7; titer resulting in 90% pseudovirus neutralization in Figure 8 and Figure 9). In contrast, no neutralizing activity was associated with serum samples generated from vehicle buffer control treated animals. Neutralizing antibody titers in vaccinated animals increased over time with the recorded neutralizing activity being consistent with the ELISA data shown in Section 5.1. Whereas sera from BNT162c1 treated animals display weak neutralizing activity both at days 10 and 31, sera from BNT162a1 treated animals display moderate neutralizing activity at day 17 that is significantly augmented at day 38. The strongest pseudovirus neutralization effect is mediated by sera generated from BNT162b1- and BNT162b2-treated rats. In case of both modRNA-based vaccines, BNT162b1 and

090177e194f4cf37\Approved\Approved On: 18-Sep-2020 13:38 (GMT)

BNT162b2, neutralizing antibody titers resulting in 50% pseudovirus neutralization exceeded the upper limit of quantification (ULOQ) of a reciprocal titer of 1536 in more than 8 out of ten animals at day 38.

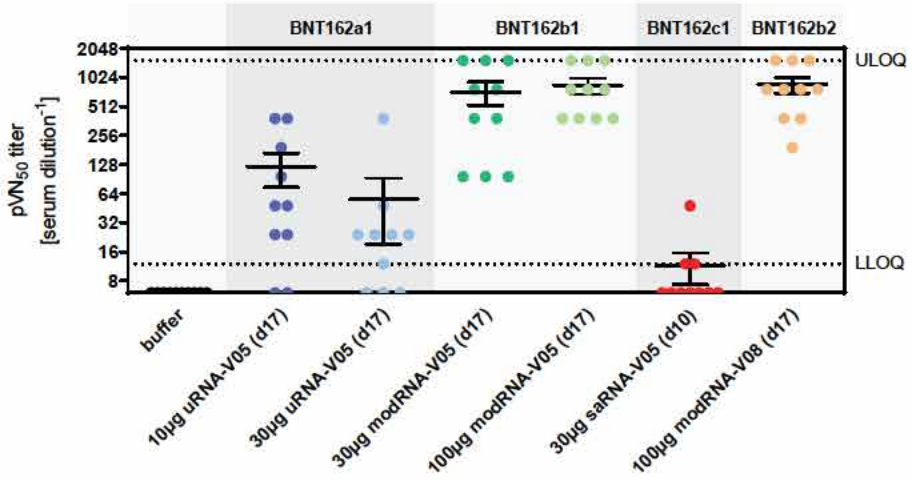

Figure 6: Pseudovirus neutralization activity of main study cohort sera plotted as pVN_{50} titer

Serum samples were collected on day 10 (BNT162c1, red dots) or day 17 (all other cohorts) after first immunization of the main study animals and titers of virus-neutralizing antibodies were determined by pseudovirus-based neutralization test (pVNT). Individual VNT titers resulting in 50% pseudovirus neutralization (pVN_{50}) are shown by dots; group mean values are indicated by horizontal bars (±SEM, standard error of the mean).

6 CONCLUSION

The available data demonstrates that all BNT162 vaccine candidates elicited a SARS-CoV-2 spike protein specific antibody response directed against the S1 domain and the RBD sub-domain. Antibody responses detected via ELISA directly translated into neutralizing activity as seen in the VSV/SARS-CoV2-S pseudovirus neutralization test with BNT162 vaccines showing higher antigen-specific antibody titers also displaying more pronounced virus neutralization effect. A comparison of the three RNA platforms with regard to their immunogenicity in rats may not be fully predictive for how they may perform relative to each other in human due to species-specific differences in immunity mechanisms.

1. AMENDED TEXT

Section: GLP Compliance Statement

Justification for revision(s): Text is being revised based on feedback from regulatory authorities to clarify that manufacturing of the test articles was conducted non-GMP but characterization of the test articles was conducted under GMP conditions, and that serology analysis was conducted under Good Clinical Laboratory Practice (GCLP).

Current:

This study was conducted in compliance with Good Laboratory Practice for Nonclinical Laboratory Studies regulations as set forth in the Code of Federal Regulations (21 CFR Part 58) with the exceptions of the analyses of alpha-1 acid glycoprotein (A1AGP) and alpha-2-macroglobulin (A2M), and testing performed on the test articles BNT162b2 (Version 9 [V9]) and BNT162b3c which were under non-GLP and non-GMP conditions, respectively. These parameters were conducted under non-GLP and non-GMP conditions and were performed according to fit-for-purpose methods. These exceptions did not have an impact on the integrity or data interpretation of the study.

Amended To:

This study was conducted in compliance with Good Laboratory Practice for Nonclinical Laboratory Studies regulations as set forth in the Code of Federal Regulations (21 CFR Part 58) with the exceptions of the analyses of alpha-1 acid glycoprotein (A1AGP) and alpha-2-macroglobulin (A2M) which were under non-GLP conditions. Manufacturing of the test articles BNT162b2 (Version 9 [V9]) and BNT162b3c was conducted under non-GMP conditions, while characterization of the test articles was conducted under GMP conditions. Serology analysis was performed in accordance with Good Clinical Laboratory Practice (GCLP). All parameters that were conducted under non-GLP and non-GMP conditions were performed according to fit-for-purpose methods. These exceptions did not have an impact on the integrity or data interpretation of the study.

ABSTRACT

BNT162b2 (Version 9 [V9]) and BNT162b3c are candidate COVID-19 vaccines, which are based on a lipid nanoparticle (LNP)-RNA platform and express the SARS-CoV-2 spike protein or its derivatives. The objective of this study was to determine the toxicity and development of a specific immune response to the antigen in each of the vaccine candidates following intramuscular (IM) administration once weekly for a total of 3 doses to Wistar Han (Crl:WI[Han]) rats. The reversibility of effects was evaluated following a 3-week recovery phase.

IM administration of BNT162b2 (V9) and BNT162b3c at 30 µg RNA/dose once weekly for a total of 3 doses to Wistar Han rats was tolerated without evidence of systemic toxicity and produced nonadverse inflammatory changes consistent with expected immune responses to vaccines.

At the conclusion of the dosing phase, test article-related immune responses to both vaccines were evident as transient edema and erythema at the injection site after each dose, transient higher mean body temperatures compared with controls after each dose, higher white blood cell count (primarily involving neutrophils, monocytes and large unstained cells), and changes in acute phase reactants (higher [alpha-1 acid glycoprotein and alpha-2-macroglobulin and fibrinogen] and lower [lower albumin and albumin:globulin (AG) ratios] acute phase proteins. These test article-related changes were fully reversed after the recovery phase, with the exception of higher red cell distribution width, higher globulins, and lower AG ratio.

Changes secondary to inflammation included lower mean body weight, lower mean food consumption, transiently lower reticulocyte counts, and minor lower red cell mass at the conclusion of the dosing phase. These changes fully resolved in the recovery phase.

At the conclusion of the dosing phase, nonadverse test article-related microscopic findings consistent with immune activation and an inflammatory response included mixed cell inflammation and edema of the injection sites (which correlated with macroscopic observations of abnormal color, dark/pale and abnormal consistency, firm), increased cellularity of plasma cells and germinal centers of the draining and inguinal lymph nodes (which correlated with macroscopic observation of abnormal size, enlarged), increased cellularity of hematopoietic cells and germinal centers of the spleen (which correlated with macroscopic observation of abnormal size, enlarged and increased spleen weights), and increased cellularity of hematopoietic cells in the bone marrow were noted. These test article-related changes fully recovered, except for partial recovery of enlarged draining and inguinal lymph nodes and microscopic findings of inflammation at the injection sites, increased cellularity of plasma cells and germinal centers in the draining and inguinal lymph nodes and increased cellularity of the germinal centers in the spleen.

In addition, test article-related vacuolation of the periportal hepatocytes in the liver was observed, in the absence of biochemical evidence of liver injury, and may be related to hepatic clearance of PEGylated lipids that are part of the LNP formulation. At the end of the 3-week recovery phase, this finding was completely recovered.

Administration of 3 once weekly doses of BNT162b2 (V9) or BNT162b3c elicited SARS-CoV-2 neutralizing antibody responses in both males and females at the end of the dosing and recovery phases of the study. SARS-CoV-2 neutralizing antibody responses were not observed in animals prior to vaccine administration or in saline-administered control animals.

In conclusion, BNT162b2 (V9) and BNT162b3c administered via intramuscular injection once weekly for a total of 3 doses to Wistar Han (Crl:WI[Han]) rats was tolerated without evidence of systemic toxicity, generated a SARS-CoV-2 neutralizing antibody response, and produced nonadverse changes consistent with an immune or inflammatory response at the conclusion of the dosing phase. At the end of the 3-week recovery phase, full or partial recovery of all findings was observed. Other nonadverse findings included vacuolation in the liver which may be related to hepatic clearance of PEGylated lipids and was noted at the conclusion of the dosing phase and completely recovered. The findings in this study are consistent with those typically associated with the intramuscular administration of LNP-encapsulated mRNA vaccines. Animals administered BNT162b2 (V9) or BNT162b3c elicited SARS-CoV-2 neutralizing antibody responses at the end of the dosing and recovery phases of the study.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

1. INTRODUCTION AND OBJECTIVE

BNT162b2 (Version 9 [V9]) and BNT162b3c are candidate COVID-19 vaccines, which consist of an LNP-encapsulated RNA encoding the SARS-CoV-2 spike protein or its derivatives. The objective of this study was to determine the toxicity and development of a specific immune response to the antigens in each of the vaccine candidates following administration of intramuscular (IM) doses once weekly for a total of 3 doses to Wistar Han (Crl:WI[Han]) rats. The reversibility of effects was evaluated following a 3-week recovery phase.

2. STUDY RATIONALE

BNT162b2 (V9) and BNT162b3c were evaluated at the highest intended dose (doses up to 30 µg of RNA administered twice) in clinical trials. Therefore, 3 IM administrations of each vaccine at 30 µg RNA for a total of 3 doses were evaluated in the current study in rats on a more accelerated schedule (once weekly) compared to the clinic. The IM route is the clinical route of administration. The rat is a standard rodent test species for use in toxicity studies and has been shown to generate an immune response to very similar types of RNA-based vaccines.

3. MULTI-SITE INFORMATION

Microscopic examination was conducted at Pfizer, Pearl River. Evaluation of Clinical Laboratory parameters was conducted at Pfizer, Pearl River. The analysis for detection of neutralizing antibody titers (serology) to wild type live SARS-CoV-2 virus was conducted at VisMederi, Srl (Siena, Italy).

3.1. Communication Method

The Principal Investigator was responsible for informing the Study Director of any deviations to the protocol or Standard Operating Procedures (SOPs) and unexpected events as they occurred during the respective study phase. Other issues were communicated at the end of the respective study phase prior to the issuance of the report.

3.2. Reporting Method

Clinical Pathology and Anatomic Pathology Principal Investigator's reports are appended to the final study report. Data and interpretation are integrated into the final study report. The Serology Principal Investigator's report is integrated and appended to the final study report.

Methods for each phase are described in the SOP of the respective test site.

a. The Pfizer lead and test site QA monitored applicable study phases, audited the final study or Principal Investigator (PI) report(s), and issued QA statement(s) for work conducted at their respective test sites according to RQA-GLP SOPs. Lead QA was responsible for coordination to ensure appropriate overall study monitoring.

b. The CRO test site QA monitored the phase, audited the CRO Principal Investigator's report, and issued a QA Statement according to CRO test site QA SOPs.

5. MATERIALS AND METHODS

For phases of the study conducted at Pfizer Worldwide Research & Development (Pfizer WRD), Groton, CT, details of methods described below are included in the Standard Operating Procedures of Pfizer WRD, Groton, CT and in the SOPs of the respective Pfizer WRD facility conducting those activities.

Minor deviations from the protocol and/or current standard operating procedures occurred and did not affect the quality, integrity or interpretations of the data or the conclusions of the study. The deviations are documented in the study records and are discussed in the appropriate section of the report.

5.1. Study Schedule

Study Initiation Date (date protocol signed):	23 Jun 2020
Experimental Start Date (first day of study-specific data collection):	24 Jun 2020
First Day of Dosing (Day 1):	06 Jul 2020
First Day of Recovery Phase:	23 Jul 2020
Dosing Phase Necropsy (first 10 animals/sex/group):	22 Jul 2020
Recovery Phase Necropsy (remaining animals):	13 Aug 2020
Experimental Completion Date (last day of study-specific data collection):	13 Aug 2020

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

5.2. Test and Control Articles

5.2.1. Test Articles

5.2.1.1. BNT162b2 (V9)

Test Article Number:	BNT162b2 (V9)
Lot Number:	COVVAC/270320
Manufacturer:	Polymun
Composition	0.5 mg/mL RNA encoding the full SARS-CoV-2 Spike (S) P2 variant protein
Expiration Date:	27 Sep 2020
Storage Conditions:	Frozen at -80°C, protected from light
Composition:	See Certificate of Analysis in Appendix C.

5.2.1.2. BNT162b3c

Test Article Number:	BNT162b3c
Lot Number:	BCV/040620
Manufacturer:	Polymun
Composition	0.5 mg/mL RNA encoding Membrane-anchored, trimerized variant of the RBD of the SARS-CoV-2 S protein
Expiration Date:	04 Dec 2020
Storage Conditions:	Frozen at -80°C, protected from light
Composition:	See Certificate of Analysis in Appendix C.

5.2.2. Control Article(s)

5.2.2.1. Vehicle

A solution of 0.9% sterile saline was used to dose the control animals (Group 1).

Excipient:	0.9% sterile saline
Lot Number:	J8L247
Expiration Date:	31 Mar 2021

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

5.2.3. Test Article Formulation and Analyses

Test Article Numbers: BNT162b2 (V9) and BNT162b3c

Type of Formulation:	Suspension
Method of Preparation:	Thawing of frozen formulation
Frequency of Preparation:	06 Jul 2020, 13 Jul 2020, and 20 Jul 2020
Storage:	Room temperature, protected from light
Formulation Handling at Time of Dispensing for Dosing:	Formulations were gently inverted to mix to ensure uniformity prior to dose administration
Stability:	2 hours from the time thaw was completed[a]
Concentration Analyses:	Not applicable; material was utilized as supplied

a. Reference: DOSAGE AND ADMINISTRATION INSTRUCTIONS FOR BNT162 (PF-07302048) VACCINE, 0.5 MG/ML (C459-INX100407124-V4.0). NOTE: Although the information in this reference document is not specific to the test articles utilized in this study, it was for the same platform of vaccines and was deemed appropriate for use.

5.3. Test System

Species:	Rat
Strain/Breed/Origin:	Wistar Han (Crl:WI[Han])
Animal Use Protocol (AUP) Number:	GTN-2011-00314
Source:	Charles River Laboratories Raleigh, NC
Age at Dose Initiation:	9 weeks
Weight at Dose Initiation:	Males: 243.1 grams - 291.6 grams Females: 172.9 grams - 209.5 grams

5.3.1. Acclimation

Animals were acclimated to the laboratory environment for a minimum of 13 days prior to initiation of dosing.

5.3.2. Identification

Animals were identified by a radio frequency identification device (RFID) implanted by the vendor (subscapular region) that was associated with a unique identification number for each animal. Each cage was labeled with a cage card for each animal in the cage.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

5.3.3. Allocation and Randomization

Clinically acceptable animals were allocated to study groups following the review of data collected prior to the initiation of dosing and using a computer-assisted randomization procedure based on body weights.

5.4. Housing and Environmental Conditions

Caging:	Housed individually in suspended cages
Bedding:	Enrich-n'Pure®, The Andersons, Inc.
Temperature:	68°F-79°F
Humidity:	30%-70%
Lighting:	Approximate 12-hour light, 12-hour dark cycle.
Water:	Municipal drinking water, further purified by reverse osmosis, was provided ad libitum.
Diet:	Certified Irradiated Rodent Diet 5002 (PMI Feeds Inc.) was provided ad libitum. Lot number(s) are included in the raw data.

There are no known contaminants in the food or water that interfered with the quality or integrity of the data.

5.5. Experimental Groups

Group Number	Test Article or Vehicle Dose (µg RNA/Dose Day)	Dose Volume (µL/injection site)[a]	Animal Numbers	
			Males	Females
1	0[b]	60	1-15	46-60
2	30[c]	60	16-30	61-75
3	30[d]	60	31-45	76-90

a. Each animal received a single intramuscular injection on each dose day.
b. Sterile saline.
c. BNT162b2 (V9).
d. BNT162b3c.

Doses were administered by a single intramuscular injection (60 µL) on each dosing day (Days 1, 8, and 15) into the left hindlimb quadriceps muscle.

The first 10 animals/sex/group, by ascending animal order, were designated for necropsy at the end of the dosing phase. The remaining 5 animals were retained for the recovery phase.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

5.6. Observations and Measurements

5.6.1. Clinical Observations/Measurements

General (Cageside) Clinical Observations:	**Days of Study**	**Time Points**
	Prior to the Initiation of Dosing (PID)	Once daily
	Nondosing Days (Dosing Phase)	Twice daily, except on days when detailed clinical observations were performed, then only once daily
	Dosing Days (Dosing Phase)	Predose, except on days that predose detailed clinical observations were performed, 4 hours after the last animal was dosed, and at the end of the workday. On 06 Jul 2020 (Day 1), clinical signs were not conducted at the end of the workday for Animals 001-090.
	Recovery Phase Days	Twice daily
Detailed Clinical Observations:	Detailed clinical observations were performed twice prior to the initiation of dosing, twice weekly at approximately the same time body weights were performed, and on the day(s) of necropsy.	
Body Weight:	All animals were weighed twice prior to the initiation of dosing on PID Phase Days 1 and 6, predose on Dosing Phase Days 1, 8, and 15; on Dosing Phase Days 4 and 11 (nondosing), and a fasted weight was collected just prior to scheduled necropsy. Body weights were collected on Recovery Phase Days 1, 4, 8, 11, 15, 18, and 21.	
Food Consumption:	Quantitative food consumption was recorded on Dosing Phase Days 4, 8, 11, and 15 and on Recovery Phase Days 4, 8, 11, 15, 18, and 21.	
Ophthalmology:	Ophthalmic examinations were performed once prior to the initiation of dosing (following randomization) on PID Phase Days 7/8 (males/females) and on Dosing Phase Days 15/16 (males/females). Recovery animals were not examined at the end of the recovery phase. See the Ophthalmology Report in Appendix B for complete materials and methods.	
Injection Site Scoring (Dermal Assessment):	Injection sites were observed during the dosing phase once predose and approximately 4 and 24 hours postdose on all animals. Animals with a score of 2 or greater at 24 hours postdose had additional evaluations at 48 and 72 hours postdose. Animals with a continued score of 2 or greater at 72 hours postdose had additional evaluations at 120 and 144 hours postdose. After dosing on Day 15, a 72-hour postdose evaluation was conducted on recovery animals only. Injection site score was recorded according to a standardized rating scale (Draize, 1959). On Dosing Phase Day 1 (06 Jul 2020), predose dermal assessments were collected on all animals for right-side injection sites (noninjection site), and at 4 hours postdose, dermal assessments were collected on Animals 1-7, 9 (Group 1, Males), and 46-58 (Group 1, Females) for right-side injection sites (noninjection site).	
Body Temperature:	Body temperature was collected on all animals once prior to the initiation of dosing on PID Phase Day 6, predose on Dosing Phase Days 1, 8, and 15, and at approximately 4 and 24 hours postdose from all animals.	

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

5.6.2. Clinical Laboratory Measurements

Schedule for Collection of Samples for Clinical Laboratory Measurements			
Parameter	**Day of Study**		
	Dosing Phase		**Recovery Phase**
	Day 4	Day 17[e]	Day 22
Hematology	X[a,c]	X[c]	X[c]
Coagulation	NA	X[c]	X[c]
Clinical Chemistry (Core Chemistry)	X[b,c]	X[c]	X[c]
Clinical Chemistry (Other Biomarkers – Acute Phase Proteins)/Serum[d]	X[b,c]	X[c]	X[c]
Urinalysis	NA	X	X

NA = Not applicable; X = Scheduled collection.
a. First 7 animals/sex/group.
b. Last 8 animals/sex/group.
c. Blood samples were collected from animals in a fasted state, with the exception of same day redraws.
d. Assay performed using shared clinical chemistry sample.
e. Evaluated on animals scheduled for necropsy.

See the Clinical Pathology Report in Appendix B for complete materials and methods.

5.6.3. Antibody (Serology) Response to Vaccine Components

Sample Collection and Storage Conditions	
Groups:	1-3
Collection Intervals:	PID Phase Day 8 and Dosing Phase Day 17[a], and Recovery Phase Day 21[a]
Collection Time Points:	PID Phase Day 8, Dosing Phase Day 17, and Recovery Phase Day 21: Once
Animals/Time Point:	All animals
Anticoagulant:	No anticoagulant
Collection Volume per Sample:	PID Phase Day 8: Approximately 0.7 mL Dosing Phase Day 17 and Recovery Phase Day 21: Approximately 1 mL
Sample Processing:	Samples were processed and stored as appropriate within 2 hours of collection
Sample Storage Conditions:	Approximately -60°C or lower

PID = Prior to initiation of dosing.
a. Samples collected prior to necropsy.

All samples collected were sent in one shipment after completion of the last blood sample collection.

Antibody Analysis	
Analysis of Samples from Control Animals (Group 1):	All samples were analyzed
Analysis of Samples from Animals Administered Test Article:	All samples were analyzed for a neutralizing antibody response to the antigens in BNT162b2 (V9) and BNT162b3c

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

Incurred Sample Reanalysis (ISR)/Project Numbers	
Antibody (Serology) Sample Analysis was conducted under the following Qualified Method ID:	PFZ_20GR142-WO4_MN SarsCov2_V2_20200924_GL

See the Serology Report in Appendix B for complete materials and methods.

5.7. Postmortem Observations

Animals (10/sex/group) were euthanized on Dosing Phase Day 17 (2 days after the last dose). Remaining animals were euthanized on Recovery Phase Day 22, the last day of the Recovery Phase (surviving animals).

Necropsy, tissue collection, organ weights, macroscopic tissue evaluation, and microscopic examination were performed.

Bone marrow smears were collected from all animals.

See the Anatomic Pathology Report in Appendix B for complete materials and methods.

5.8. Statistical Analysis

Statistical analyses of body weight, body weight change, and food consumption data were conducted in Pristima and analyses of body temperature and injection site scores were conducted by DSRD Statistics using iStats v1.0 with the methods outlined below. All analyses were performed separately for each sex.

Descriptive statistics were generated for each parameter and group at each scheduled sampling time or each time interval. Statistical tests were conducted at the 5% and 1% significance levels.

Analyses of body weight and food consumption parameters were done on measurements collected for each animal at the scheduled sampling times or time intervals. In addition, body weight change at selected intervals was analyzed. Analysis of body temperature was based on the maximum body temperature after injection for each animal. Analysis of injection site score was based on the average irritation score after injection for each animal.

A nonparametric (rank-transform) one way analysis of variance (ANOVA) on all groups was conducted, with two-sided pairwise comparisons of Groups 2 and 3 to Group 1 using Dunnett's test. Average ranks were assigned to ties.

For statistical analysis performed for contributing scientist activities/measurements, see the corresponding report in Appendix B.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

5.9. Data Acquisition

The following primary computer applications were used for the collection of data.

Computer Application	Data Collected/Usage
Pristima Preclinical Data Management Suite (Version 7.4.3)	In-life activities
DVMAX Research Version 3.1.2	Animal health records
Microsoft Excel	Sample tracking and antibody immunoassay result storage. Duplicate titration for each sample, provided two neutralization titers (MNt) for each sample. Information was documented according to VisMederi, Srl Standard Operating Procedures (WI-MNSARS-CoV-2) are stored in an Excel sheet (the basic format is provided in dedicated VisMederi, Srl procedure).
iStats Version 1.0	Statistical analysis

For data acquisition systems and version numbers of each of these systems used for contributing scientist/principal investigator activities/measurements, see the corresponding report in Appendix B.

5.10. Data Management and Archives

Data	Location of Archive
Raw data, documentation, protocol and amendments, final report, and any specimens generated at the Test Facility	Pfizer, Groton, CT
Raw data and documents electronically archived	Pfizer OpenLab archive system or locked and retained in the source computerized system, as defined as per SOP.
Materials are retained in accordance with the Enterprise Records Retention Schedule.	
Raw data, working sheets and any template required by method procedure are archived as hard copies (original documents) in fireproof archives up to 25 years. Electronic format outputs are regularly backed up and archived in Microsoft cloud.	

6. RESULTS

6.1. Clinical Observations/Measurements

6.1.1. Mortality

Individual animal mortality data are included in Appendix 1.

There was no unscheduled euthanasia. All animals administered BNT162b2 (V9) or BNT162b3c survived to scheduled necropsy at the end of the dosing or recovery phase of the study.

6.1.2. Clinical Signs

An incidence summary of clinical signs is presented in Table 1. Individual animal clinical signs are included in Appendix 2.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

There were no test article-related clinical signs noted for animals administered BNT162b2 (V9) or BNT162b3c during the dosing or recovery phase.

6.1.3. Body Weight

Group mean body weight data are presented in Table 3. Group mean body weight change during interval data are presented in Table 4. Individual animal body weight data are included in Appendix 4. Individual animal body weight change during interval data are included in Appendix 5.

Dosing Phase

No test article-related mean body weight changes were noted for animals administered BNT162b2 (V9) during the dosing phase.

Test article-related lower mean body weight (0.93x-0.94x control) was noted in males only on Days 11 and 15 for BNT162b3c during the dosing phase.

Recovery Phase

Test article-related higher mean body weight (1.05-1.06x control) was noted in males only on Recovery Days 11, 15, 18 and 21 for animals administered BNT162b2 (V9).

No test article related body weight changes were noted for animals administered BNT162b3c during the recovery phase.

Other differences between test article and control group were not test article-related due to the small magnitude of the change, inconsistent direction of the difference, and/or inconsistency of the response.

6.1.4. Food Consumption

Group mean food consumption data are presented in Table 5. Individual animal food consumption data are included in Appendix 6.

Dosing Phase

Test article-related lower mean food consumption (0.83x-0.87x control) was noted on Days 4 and 11 for animals administered BNT162b2 (V9) during the dosing phase.

Test article-related lower mean food consumption (0.76x-0.92x control) was noted on Days 4 and 11 for animals administered BNT162b3c during the dosing phase.

Recovery Phase

Test article-related higher mean food consumption (1.08x-1.35x control) was noted throughout the recovery phase for male animals administered BNT162b2 (V9).

Test article-related higher mean food consumption (1.08x-1.30x control) was noted on Recovery Phase Days 4 and 11 for male animals administered BNT162b3c.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

Other differences between test article and control group were not test article-related due to the small magnitude of the change, inconsistent direction of the difference, and/or inconsistency of the response.

6.1.5. Dermal Assessment

Group mean dermal assessment data are included in Table 12. Individual dermal assessment data are included in Appendix 12.

Dosing Phase

BNT162b2 (V9)-related injection site edema Grade 2 (slight, edges of area well defined by definite raising) or Grade 3 (moderate, raised approximately 1 mm) were noted in all animals (except Animal 17), and occurred following dosing on Days 1, 8 and/or 15 (see Text Table 1). The edema was generally observed up to 72 hours postdose, and fully resolved prior to dose administration on Days 8 and 15. Erythema was also observed at the injection site in all animals (except Animals 16-21 and 30), following each dose administration, however, it was only a Grade 1 (very slight, barely perceptible) and fully resolved prior to the next dose administration.

BNT162b3c-related injection site edema Grade 2 (slight, edges of area well defined by definite raising) or Grade 3 (moderate, raised approximately 1 mm) were noted in all animals, and occurred following dosing on Days 1, 8 and/or 15 (see Text Table 2). The edema was generally observed up to 72 hours postdose, and fully resolved prior to dose administration on Days 8 and 15. Erythema was also observed at the injection site in all animals (except Animal 39), following each dose administration, however, it was only a Grade 1 (very slight, barely perceptible) and fully resolved prior to the next dose administration.

Text Table 1. BNT162b2 (V9) Animals with Injection Site Edema Score ≥ 2

Animal	Clinical Sign	Total Number of Days (Dosing Phase Study Day of Occurrence)
16 M	Edema, Grade 2	1 (D16: 24 HPD)
18 M	Edema, Grade 2	4 (D9: 24 HPD; D10: 48 HPD; D16: 24 HPD; D17: 48 HPD)

Note: Doing Days = 1, 8, and 15.
D = Dosing Phase Day; F = Female; HPD = Hours postdose; M = Male.
Grade 0 = No edema; 1 = Very slight edema (barely perceptible); 2 = Slight edema (edges of area well defined by definite raising); 3 = Moderate edema (raised approximately 1 millimeter); 4 = Severe edema (raised more than 1 millimeter and extends beyond the area of exposure).

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

Recovery Phase

BNT162b2 (V9)-related injection site edema Grade 2 (slight, edges of area well defined by definite raising) or Grade 3 (moderate, raised approximately 1 mm) was noted in 2/5 males and 5/5 females following dosing on Day 15 (see Text Table 3). The edema was generally observed up to 72 hours postdose, and fully resolved. Erythema was also observed at the injection site in 2/5 females after the final dose administration, however, it was only Grade 1 (very slight, barely perceptible) and fully resolved.

BNT162b3c -related injection site edema Grade 2 (slight, edges of area well defined by definite raising) or Grade 3 (moderate, raised approximately 1 mm) was noted in 4/5 males and 5/5 females following dosing on Day 15 (see Text Table 4). The edema was generally observed up to 72 hours postdose, and fully resolved. Erythema was also observed at the injection site in 4/5 females after the final dose administration, however, it was only Grade 1 (very slight, barely perceptible) and fully resolved.

Text Table 3. BNT162b2 (V9) Animals with Injection Site Edema Score ≥ 2

6.1.6. Body Temperature

Group mean body temperature data are included in Table 13. Individual body temperature data are included in Appendix 13.

Test article-related higher mean body temperature differences from control were noted on Days 1 (+0.42°C-0.54°C), 8 (+0.66°C-0.98°C), and 15 (+0.13°C-1.03°C) following dose administration of BNT162b2 (V9).

Test article-related higher mean body temperature differences from control were noted on Days 1 (+0.50°C-0.71°C), 8 (+0.92°C-1.26°C) and 15 (+0.33°C-1.09°C) following dose administration of BNT162b3c.

Additional body temperature evaluations were not needed at 48 and 72 hours postdose as individual animal body temperatures were ≤40°C at 24 hours postdose.

6.1.7. Ophthalmology

The complete Ophthalmology Report is included in Appendix B and a summary of the results is included below.

There were no test article-related ophthalmic findings noted at the conclusion of the dosing phase. Recovery phase examinations were not performed due to no findings observed at the conclusion of the dosing phase.

6.2. Clinical Laboratory Measurements

The complete Clinical Pathology Report is included in Appendix B and a summary of the results is included below.

Dosing Phase

Test article-related hematology and coagulation findings were similar in rats administered either BNT162b2(V9) or BNT162b3c and included higher mean white blood cell (WBC) counts and fibrinogen concentrations, lower (Day 4) and higher (Day 17) reticulocyte counts, and lower red blood cell mass (red blood cell count, hemoglobin and hematocrit) as compared with controls.

Higher WBC primarily involved higher neutrophils, monocytes and large unstained cells , but also eosinophils and basophils. They were present on Days 4 and 17, with higher counts on Day 17 than Day 4. On Day 17, there were also test article-related higher fibrinogen concentrations in both sexes. Hypersegmented neutrophils were present on peripheral blood smears of test article-dosed animals.

In addition, there were test article-related transiently lower reticulocyte counts on Day 4, and higher reticulocytes on Day 17 (females only) with attendant expected changes in RBC indices (higher mean cell hemoglobin concentration; males on Day 4; lower mean cell hemoglobin [MCH] and higher red cell distribution width on Day 17; both sexes). These

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

were associated with lower RBC mass on Days 4 and 17 (comparable on both days or slightly lower on Day 17).

Test article-related clinical chemistry findings were similar in rats administered either BNT162b2(V9) or BNT162b3c and included higher mean alpha-1 acid glycoprotein and alpha-2-macroglobulin and lower AG ratios (primarily due to lower albumin with slight contribution from higher globulins) on Days 4 and 17 in both sexes.

Recovery Phase

All test article-related hematology and coagulation changes noted in the dosing phase were fully reversed after a 3-week recovery phase, with the exception of higher red cell distribution width.

All test article-related clinical chemistry changes noted in the dosing phase were fully reversed after a 3-week recovery phase, with the exception of higher globulins in males administered BNT162b2(V9) and females administered BNT162b2(V9) and BNT162b3c and lower AG ratio in females administered BNT162b2(V9).

There were no test article-related findings noted in urinalysis parameters in the dosing or recovery phase.

6.2.1. Bone Marrow Assessment

The complete Clinical Pathology Report is included in Appendix B and a summary of the results is included below.

Bone marrow smears were prepared for all animals and were not examined.

6.3. Antibody (Serology) Analysis

The complete Serology Report is included in Appendix B and a summary of the results is included below.

Administration of 3 once weekly doses of BNT162b2 (V9) or BNT162b3c elicited SARS-CoV-2 neutralizing antibody responses in males and females at the end of the dosing (Day 17) and recovery phases (Day 21) of the study. SARS-CoV-2 neutralizing antibody responses were not observed in animals prior to vaccine administration or in saline-administered control animals.

6.4. Postmortem Observations

The complete Anatomic Pathology Report is included in Appendix B and a summary of the results is included below.

Dosing Phase

Test article-related organ weight differences included higher absolute and relative (to body and brain weight) spleen weights in males and females administered BNT162b2 (V9) or BNT162b3c.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

Test article-related macroscopic findings included large draining lymph nodes (abnormal size, enlarged) and dark/pale and/or firm injection sites (abnormal color, dark/pale and/or abnormal consistency, firm) in animals administered BNT162b2 (V9) or BNT162b3c, and large spleen and inguinal lymph nodes (abnormal size, enlarged) in animals administered BNT162b3c.

Organs with test article-related microscopic findings included the injection site (mixed cell inflammation and edema), draining and inguinal lymph nodes (increased cellularity, plasma cells and germinal centers), liver (hepatocellular vacuolation), spleen (increased cellularity, hematopoietic cells and germinal centers), and bone marrow (increased cellularity, hematopoietic cells) in both males and females administered BNT162b2 (V9) or BNT162b3c.

Recovery Phase

No test article-related organ weight changes were noted at the end of the recovery phase.

Test article-related macroscopic findings observed at the end of the recovery phase were limited to large draining lymph nodes (abnormal size, enlarged) in 1 male administered BNT162b2 (V9) and 1 female administered BNT162b3c and large inguinal lymph nodes (abnormal size, enlarged) in 1 female administered BNT162b3c, indicating a partial recovery of these findings. Pale/dark and/or firm injection sites and enlarged spleen were not observed at the end of recovery phase in BNT162b2 (V9) or BNT162b3c administered males and females, indicating a complete recovery of these findings.

Test article-related microscopic findings noted at the end of the dosing phase including edema at the injection site, hepatocellular vacuolation in the liver, and increased cellularity of hematopoietic cells in the spleen and bone marrow were not observed at the end of recovery phase in BNT162b2 (V9) or BNT162b3c administered males and females, indicating a complete recovery of these findings. Inflammation at the injection site was characterized by mostly lymphocytes and plasma cells with few neutrophils (indicating partial recovery) and no edema (full recovery). However, increased cellularity of the germinal centers in the spleen partially recovered, as the incidence and/or severity of these findings were lower in recovery phase animals as compared with dosing phase animals in both males and females administered BNT162b2 (V9) or BNT162b3c. At the end of recovery phase, mature plasma cells had replaced the plasmablasts identified in the inguinal and draining lymph nodes in the dosing phase animals. In recovery phase animals, infiltration of macrophages was observed in the draining lymph nodes (minimal to mild) in both sexes administered BNT162b2 (V9) or BNT162b3c and in the inguinal lymph nodes (minimal) in both sexes administered BNT162b2 (V9). This finding was considered indicative of a reparative process (consequence of phagocytosis), which can be seen following inflammatory reactions at the injection sites.

7. INTEGRATED SUMMARY AND DISCUSSION OF RESULTS

Intramuscular administration of BNT162b2 (V9) and BNT162b3c at 30 µg RNA/dose day once weekly for a total of 3 doses to Wistar Han rats was tolerated during the dosing phase without evidence of systemic toxicity, generated a SARS-CoV-2 neutralizing antibody

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

response, and produced nonadverse changes consistent with inflammatory and immune responses to vaccine administration.

At the conclusion of the dosing phase, test article-related responses to both vaccines were evident as transient edema (very slight to moderate) and erythema (very slight) at the injection site after each dose of BNT162b2 (V9) and BNT162b3c. Test article-related erythema and edema fully resolved prior to subsequent dose administration on Days 8 and 15 with findings generally resolved by 72 hours after the final dose administration (Recovery Phase Day 1). Transiently higher body temperature differences compared with concurrent controls were noted on Days 1 (up to +0.71°C), 8 (up to +1.26°C) and 15 (up to +1.09°C) post administration of BNT162b3c and on Days 1 (up to +0.54°C), 8 (up to +0.98°C), and 15 (up to +1.03°C) after administration of BNT162b2 (V9). Additional body temperature evaluations were not needed at 48 and 72 hours postdose as individual animal body temperatures were ≤40°C at 24 hours postdose.

Changes secondary to inflammation included lower mean body weight (0.93x-0.94x control on Days 11 and 15) in male animals administered BNT162b3c and lower mean food consumption (0.83x-0.87x control on Days 4 and 11) for animals administered BNT162b2 (V9) and BNT162b3c (0.76x-0.92x control on Days 4 and 11) during the dosing phase. These changes fully resolved in the recovery phase as higher mean body weight (1.05-1.06x control) was noted in males only administered BNT162b2 (V9). Additionally, higher mean food consumption (1.08x-1.35x control) was noted throughout the recovery phase for male animals administered BNT162b2 (V9) and BNT162b3c (1.08x-1.30x control).

At the conclusion of the dosing phase, all clinical pathology findings (type and magnitude) were generally similar between rats administered BNT162b2 (V9) or BNT162b3c, and consistent with expected immune responses to vaccines or secondary to inflammation. The main findings were present in both sexes on Days 4 and/or 17 and included higher acute phase proteins (alpha-1 acid glycoprotein; 7.0x-42x controls], alpha-2-macroglobulin (3.3x-128x] and fibrinogen [2.4x-2.6x]) and white blood cell count (1.28x-2.95x; primarily involving neutrophils, monocytes and large unstained cells, which typically represent large mononuclear cells) and lower albumin:globulin (0.90x-0.82x). Hypersegmented neutrophils present on peripheral blood smears were considered to be secondary to the robust increases in neutrophil counts and likely related to mobilization of bone marrow storage neutrophils and prolonged neutrophil lifespan in circulation (Ulich et al, 1988). Collectively, these findings were consistent with immune responses to vaccines. Microscopic correlates included minimally increased cellularity of hematopoietic cells (primarily myeloid) in the bone marrow and the spleen, minimal to moderate mixed cell inflammation at the injection site and increased cellularity in germinal centers of lymphoid organs. In addition, there were transiently lower reticulocyte counts on Day 4 (0.44x-0.27x), and higher reticulocytes on Day 17 (1.20x-1.31x; females only), with minor lower red cell mass on Days 4 and 17 (HCT; 0.93x-0.89x). Lower reticulocytes were interpreted to be a transient effect of innate immune responses (Abreu et al, 2018; Brooks et al, 2017; Kim et al, 2014; Wrighting & Andrews, 2006).

All test article-related clinical pathology parameter changes were fully reversed after a 3-week recovery phase, with the exception of higher red cell distribution width in males and

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

females administered BNT162b2(V9) (1.13x and 1.21x, respectively) and BNT162b3c (1.12x and 1.23x, respectively), higher globulins in males administered BNT162b2(V9) (1.08x) and females administered BNT162b2(V9) (1.06x) and BNT162b3c (1.07x) and lower AG ratio in females administered BNT162b2(V9) (0.91x).

Test article-related microscopic pathology findings were observed at the injection site and in the lymph nodes, spleen, bone marrow, and liver for both vaccine candidates. All microscopic findings were nonadverse, as there was no evidence of systemic toxicity or clinical signs of illness or lameness.

At the end of the dosing phase, test article-related mixed cell inflammation (mild to moderate) and edema (mild to moderate) at the injection site were consistent with findings typically associated with the IM administration of lipid nanoparticle (LNP)-encapsulated mRNA vaccines (Hassett et al, 2019). These findings correlated with macroscopic observations of abnormal color (dark/pale) and consistency (firm). At the end of the 3-week recovery phase, full recovery occurred for macroscopic findings of pale/dark and firm injection sites and the microscopic finding of edema, whereas partial recovery occurred for inflammation at the injection sites.

At the end of the dosing phase, test article-related findings in the lymph nodes (increased cellularity of plasma cells [minimal to moderate] and germinal centers [minimal to mild]), spleen (increased cellularity of hematopoietic cells [minimal] and germinal centers [minimal]), and the bone marrow (minimal increased cellularity of hematopoietic cells) were secondary to immune activation and/or inflammation at the injection site. The presence of plasma cells (interpreted as plasmablasts) in the draining and inguinal lymph nodes was interpreted to reflect a robust immunological response to the vaccines. These observations correlated with macroscopic observations of abnormal size (enlarged) in the lymph nodes and spleen and increased spleen weights. At the end of the 3-week recovery phase, full recovery occurred for higher spleen weights, macroscopic finding of enlarged spleen, and microscopic findings of increased cellularity of hematopoietic cells in the spleen and bone marrow, whereas partial recovery occurred for macroscopic findings of enlarged draining and inguinal lymph nodes, microscopic findings of increased cellularity of plasma cells and germinal centers in the draining and inguinal lymph nodes, and increased cellularity of the germinal centers in the spleen.

At the end of the dosing phase, test article-related microscopic finding of minimal portal hepatocyte vacuolation was not associated with hepatic tissue damage or liver enzyme alterations. This change may be related to hepatic clearance of the pegylated lipid in the LNP (Ivens et al, 2015). At the end of 3-week recovery phase, this finding was completely recovered.

Administration of 3 once weekly doses of BNT162b2 (V9) or BNT162b3c elicited SARS-CoV-2 neutralizing antibody responses in both males and females at the end of the dosing (Day 17) and recovery phases (Day 21) of the study. SARS-CoV-2 neutralizing antibody responses were not observed in animals prior to vaccine administration or in saline-administered control animals.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

There were no other test article-related effects in the study.

8. CONCLUSIONS

In conclusion, BNT162b2 (V9) and BNT162b3c administered via intramuscular injection once weekly for a total of 3 doses to Wistar Han (Crl:WI[Han]) rats was tolerated without evidence of systemic toxicity, generated a SARS-CoV-2 neutralizing antibody response, and produced nonadverse changes consistent with an immune or inflammatory response at the conclusion of the dosing phase. At the end of the 3-week recovery phase, full or partial recovery of all findings was observed. Other nonadverse findings included vacuolation in the liver which may be related to hepatic clearance of PEGylated lipids and was noted at the conclusion of the dosing phase and completely recovered. The findings in this study are consistent with those typically associated with the intramuscular administration of LNP-encapsulated mRNA vaccines. Animals administered BNT162b2 (V9) or BNT162b3c elicited SARS-CoV-2 neutralizing antibody responses at the end of the dosing and recovery phases of the study.

Footnotes

Note: Sample size is displayed in ( ) before the mean value.
SD = Standard Deviation; - = Value not applicable;
Units are displayed in the ( ) under each parameter name;
HPD = Hours Post Dose; U = Unscheduled;
e = Group mean excluded from statistics;
REF = Denotes group used as reference in the statistical test;
* = Statistically significant pairwise comparison at 0.05 level;
† = Statistically significant pairwise comparison at 0.01 level;
‡ = Statistically significant trend at 0.05 level;
§ = Statistically significant trend at 0.01 level.
+ = Ascending trend sign;
- = Descending trend sign;
= Individual parameter values reported as less than or greater than limit of quantitation are set equal to the limit to calculate the average.

Clinical Chemistry

20GR142 : 17-DAY INTRAMUSCULAR TOXICITY STUDY IN WISTAR HAN RATS WITH A 3-WEEK RECOVERY

Parameter	Description
ALT	Alanine Aminotransferase
AST	Aspartate Aminotransferase
ALP	Alkaline Phosphatase
GGT	Gamma Glutamyl Transferase
TBIL	Bilirubin, Total
CHOL	Cholesterol
TRIG	Triglycerides
GLUC	Glucose
TP	Protein, Total
ALB	Albumin
GLOB	Globulin
AG	Albumin/Globulin Ratio
BUN	Blood Urea Nitrogen
CREA	Creatinine
PHOS	Phosphorus
CA	Calcium
NA	Sodium
K	Potassium
CL	Chloride
A2M	Alpha-2-Macroglobulin

Parameter	Description
A1AGP	Alpha-1 Acid Glycoprotein

Table 7

Clinical Chemistry

20GR142 : 17-DAY INTRAMUSCULAR TOXICITY STUDY IN WISTAR HAN RATS WITH A 3-WEEK RECOVERY

Footnotes

Note: Sample size is displayed in ( ) before the mean value.
SD = Standard Deviation; - = Value not applicable;
Units are displayed in the ( ) under each parameter name;
HPD = Hours Post Dose; U = Unscheduled;
e = Group mean excluded from statistics;
REF = Denotes group used as reference in the statistical test;
* = Statistically significant pairwise comparison at 0.05 level;
† = Statistically significant pairwise comparison at 0.01 level;
‡ = Statistically significant trend at 0.05 level;
§ = Statistically significant trend at 0.01 level.
+ = Ascending trend sign;
- = Descending trend sign;
= Individual parameter values reported as less than or greater than limit of quantitation are set equal to the limit to calculate the average.

Hematology and Coagulation
20GR142 : 17-DAY INTRAMUSCULAR TOXICITY STUDY IN WISTAR HAN RATS WITH A 3-WEEK RECOVERY

Parameter	Description	Parameter	Description
RBC	Red Blood Cells	BASO	Basophil, Absolute
HGB	Hemoglobin	BASO_P	Basophil
HCT	Hematocrit	LUC	Large Unstained Cells, Absolute
MCV	Mean Cell Volume	LUC_P	Large Unstained Cells
MCH	Mean Cell Hemoglobin	MORPH	Morphology
MCHC	Mean Cell Hemoglobin Conc	POIK	Poikilocytosis
RDW	Red Cell Distribution Width	BURR	Burr Cells
RETIC_P	Reticulocyte	SCHISTO	Schistocytes
RETIC	Reticulocyte, Absolute	SPHERO	Spherocytes
PLT	Platelets	SIDERO	Siderocyte-like Inclusions
MPV	Mean Platelet Volume	TARGET	Target Cells
WBC	White Blood Cells	TEAR	Tear Drop Cells
NEUT	Neutrophil, Absolute	B_STIP	Basophilic Stippling
NEUT_P	Neutrophil	HJ	Howell-Jolly Bodies
LYM	Lymphocyte, Absolute	AGGL	Agglutination
LYM_P	Lymphocyte	CLPLT	Clumped Platelets
MONO	Monocyte, Absolute	HGB_CRYS	Hemoglobin Crystals
MONO_P	Monocyte	BASOPH	Basophilia
EO	Eosinophil, Absolute	ACANTH	Acanthocytes
EO_P	Eosinophil	STOM	Stomatocytes

Hematology and Coagulation
20GR142 : 17-DAY INTRAMUSCULAR TOXICITY STUDY IN WISTAR HAN RATS WITH A 3-WEEK RECOVERY

Comment	Description
CE	Critical result for Subject # RatWis042 ; Time point R022 transmitted electronically to clinically responsible personnel.
CE	Critical result for Subject # RatWis044 ; Time point R022 transmitted electronically to clinically responsible personnel.
CL	Clotted
FT	Subject# Ratwis031; Timepoint D004; Lymphocytes
NS	No Sample
QN	Quantity Not Sufficient
RP	Clumped platelets on original result; sample redrawn and reported.
RR	Result repeated
RW	RDW and MCV not reportable due to abnormal cytogram
SR	Slide Reviewed

Clinical Chemistry

20GR142 : 17-DAY INTRAMUSCULAR TOXICITY STUDY IN WISTAR HAN RATS WITH A 3-WEEK RECOVERY

Parameter	Description
ALT	Alanine Aminotransferase
AST	Aspartate Aminotransferase
ALP	Alkaline Phosphatase
GGT	Gamma Glutamyl Transferase
TBIL	Bilirubin, Total
CHOL	Cholesterol
TRIG	Triglycerides
GLUC	Glucose
TP	Protein, Total
ALB	Albumin
GLOB	Globulin
AG	Albumin/Globulin Ratio
BUN	Blood Urea Nitrogen
CREA	Creatinine
PHOS	Phosphorus
CA	Calcium
NA	Sodium
K	Potassium
CL	Chloride
HEM_IND	Hemolytic Index

Parameter	Description
ICT_IND	Icterus Index
LIP_IND	Lipemic Index
A2M	Alpha-2-Macroglobulin
A1AGP	Alpha-1 Acid Glycoprotein

Individual Macroscopic and Microscopic Observations w/Correlations

20GR142 : 17-DAY INTRAMUSCULAR TOXICITY STUDY IN WISTAR HAN RATS WITH A 3-WEEK RECOVERY

Animal #	Sex	Group #	Dose	Day of Death	Phase	Status
017	M	2	30 µg/day	17	Dosing	Terminal Euthanasia

Tissue	Macroscopic Observations / comments	Status	Microscopic Observations / comments
Bone Marrow, Sternum	No macroscopic observations on tissue		Increased cellularity, Hematopoietic cell, Minimal
Joint	No macroscopic observations on tissue		Inflammation, Extra-capsular, Minimal
Liver			Vacuolation, Hepatocyte; Periportal, Minimal
	Abnormal surface, Raised, Focal, < 0.3 cm	Not Correlated	
Lung			Tissue is unremarkable
	Abnormal color, Pale, Focal, Right caudal lobe	Not Correlated	
Lymph Node, Draining	Abnormal size, Enlarged, Left	Correlated	Increased cellularity, Germinal center, Mild
	Abnormal size, Enlarged, Left	Correlated	Increased cellularity, Plasma cell, Mild
Site, Injection	Abnormal color, Dark, Focal, 0.3-0.5 cm	Correlated	Edema, Mild
	Abnormal color, Dark, Focal, 0.3-0.5 cm	Correlated	Inflammation, Moderate
	Abnormal consistency, Firm, Focal	Correlated	Edema, Mild
	Abnormal consistency, Firm, Focal	Correlated	Inflammation, Moderate
Spleen	No macroscopic observations on tissue		Increased cellularity, Germinal center, Minimal
			Increased cellularity, Hematopoietic cell, Minimal

The following required protocol tissues were not examined microscopically:

No Tissues to list

Ophthalmology Report for Study 20GR142

1. INTRODUCTION AND OBJECTIVE

BNT162b2 (Version 9 [V9]) and BNT162b3c are candidate COVID-19 vaccines, which are based on an RNA platform and express the SARS-CoV-2 spike protein or its derivatives. The objective of this study was to determine the toxicity and development of a specific immune response to the antigens in each of the vaccine candidates following administration of intramuscular (IM) doses once weekly for a total of 3 doses to Wistar Han (Crl:WI[Han]) rats. The reversibility of effects was evaluated following a 3-week recovery phase.

Group designations and doses are indicated in the table below.

Group Number	Test Article or Vehicle Dose (µg RNA)/Dose Day	Dose Volume (µL/injection site)[a]	Animal Numbers	
			Males	Females
1	0[b]	60	1-15	46-60
2	30[c]	60	16-30	61-75
3	30[d]	60	31-45	76-90

a. Each animal received a single intramuscular injection on each dose day.
b. Sterile saline.
c. BNT162b2 (V9).
d. BNT162b3c.

Doses were administered by a single intramuscular injection (60 µL) on each dosing day (Days 1, 8, and 15) into the left hindlimb quadriceps muscle.

The first 10 animals/sex/group, by ascending animal order, were designated for necropsy at the end of the dosing phase. The remaining animals were retained for the recovery phase.

2. MATERIALS AND METHODS

Ophthalmic examinations were performed on animals (Groups 1-3) prior to the initiation of dosing (PID) on PID Day 7 for males and PID Day 8 for females, except for Animal 88 examined on PID Day 9, and on Day 15 for males and Day 16 for females. Tropicamide 1% was administered topically to each eye to facilitate the examination. Indirect ophthalmoscopy was used for examinations. Handheld slit lamp biomicroscopy was also used at the discretion of the examiner.

3. DATA ACQUISITION

Pristima Preclinical Data Management Suite (Version 7.4.3) was used to record ophthalmology data.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

4. DATA MANAGEMENT AND ARCHIVES

All raw data and the original report pertaining to this phase of the study are retained at Pfizer, DSRD, Groton, CT (USA). A copy of this report is appended to the study report.

Materials including raw data and documents electronically archived are retained in the Pfizer OpenLab archive system or locked and retained in the source computerized system, as defined per SOP.

5. RESULTS

An incidence summary of ophthalmic findings is presented in Table 2. Individual animal ophthalmic findings are included in Appendix 3.

Ophthalmic examinations of rats performed prior to initiation of dosing were within normal limits, except for incidental findings noted in the following animals: mild unilateral vitreous hemorrhage in Animal 8, minimal unilateral tortuous retinal vessels in Animal 10, minimal unilateral vitreous hyaloid remnant in Animal 11, and mild unilateral keratic precipitates in Animal 14 and Animal 41.

No test article-related ophthalmic findings were observed in rats at the end of the dosing phase.

The mild unilateral keratic precipitates observed on Day 16 in Animal 49 is a recognized spontaneous finding in Wistar Han rats and was not considered test article related (Williams, 2013). The Day 15 ophthalmic findings in Animals 8, 10, 11, 14, and 41 were consistent with those observed on PID Day 7.

Ophthalmic examinations were not conducted during the recovery phase due to the lack of test article-related changes at the end of the dosing phase.

6. INTEGRATED SUMMARY AND DISCUSSION OF RESULTS

Clinical ophthalmic parameters of rats examined in this study were not affected following 3 intramuscular doses of BNT162b2 (V9) or BNT162b3c administered 1 week apart.

VISMEDERI

1. PURPOSE

This Phase Report describes the activities completed by VisMederi applying the Microneutralization (MN) assay for serological detection of SARS-CoV-2 specific neutralizing antibodies in animal sera relative to the "Work order 4" agreed between VisMederi Srl and Pfizer.

2. STUDY MANAGEMENT

The BNT162b2 (V9) and BNT162b3c candidate COVID-19 vaccines, based on an RNA platform and target the SARS-CoV-2 spike protein, were evaluated through the 20GR142 study for toxicity and immune response development.

BNT162b2 (V9) and BNT162b3c were administered by intramuscular (IM) doses once weekly for a total of 3 doses to male and female Wistar Han (Crl:WI[Han]) rats. Animals received the vehicle or test article at doses of 30 µg RNA/Dose Day followed by a 3-week recovery phase. Group designations and doses are indicated in the table below.

Experimental Design				
Group Number	**Test Article or Vehicle Dose/Dose Day (µg/Dose Day)**	**Dose Volume (µL/injection site)[a]**	**Animal Numbers**	
			Males	**Females**
1	0[b]	60	1-15	46-60
2	30[c]	60	16-30	61-75
3	30[d]	60	31-45	76-90

a. Each animal received a single injection on each dose day.
b. Sterile saline
c. BNT162b2(V9)
d. BNT162b3c

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

Doses were administered by a single intramuscular injection on each dosing day (60 µL) administered into the left hindlimb quadriceps muscle on Days 1, 8, and 15.

The first 10 animals/sex/group, by ascending animal order, were designated for necropsy at the end of the dosing phase. The remaining animals were retained for the recovery phase.

Samples for antibody response to the vaccine components were collected prior to dose initiation (PID) on PID Day 8 (Day -5), during the dosing phase on Day 17, and during the recovery phase (RP) on RP Day 21 (Day 38).

VisMederi performed immunogenicity tests on rats samples, testing for detection of neutralizing antibody titers to wild type live Sars-CoV-2 virus.
The assay was performed according to VisMederi internal working instruction "Microneutralization CPE-based assay for SARS-COV-2" (WI-MNSARS-CoV-2), in accordance with the Good Clinical Laboratory Practice 2009/2013 (GCLP).

VisMederi received, on August 24th 2020, 210 rat's serum samples, from Pfizer DSRD – Eastern Point Road, Groton, CT 06340, USA, for study 20GR142 with BNT162b2 (V9) and BNT162b3c. In particular, the shipment contained prior to initiation of dosing (PID) Day 8 (Day -5) and dosing phase Day 17 time-points samples of 90 animals and recovery phase (RP) Day 21 (Day 38) time-points from 30 rats.

Upon arrival, all samples passed a visual check of the physical characteristics and correspondence with material shipping inventory, according to the SOP-HBM of VisMederi, and they were stored in a freezer at -20°C (VM-F-009).

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

Each serum sample of study 20GR142 has been tested in duplicate for serological detection of SARS-CoV-2 specific neutralizing antibodies.
The SARS-CoV-2 2019 live wild type virus 2019-nCoV strain 2019-nCov/Italy-INMI1 was obtained by VisMederi Srl from the European Virus Archive Global (EVAg).
The strain information are available at the following link:
https://www.european-virus-archive.com/virus/human-2019-ncov-strain-2019-ncovitaly-inmi1

The virus growth was carried out by VisMederi Research Srl, according to VisMederi Research procedure "Virus Growth in cell culture" (SOP-VGC) in epithelial cell line, VERO E6 cells (from kidney of a normal monkey Cercopithecus aethiops) provided by the American Type Culture Collection (ATCC - CRL 1586).

The internal virus batch applied for MN analyses was VMR_SARSCOV2VEROE6_280420_C1.
The Microneutralization assay for SARS-CoV-2 on rat sera samples were performed on 8th – 11th September 2020 in the VisMederi BSL3 laboratories in accordance to the SOP-HSAL of VisMederi.

QA Statement and Regulatory Statement

The work was conducted in accordance with the procedures in force and following the GCLP guidelines and under ISO 9001:2015.
All the laboratory staff involved was trained in recording the raw data of the study in a timely and accurate manner, and aware of the responsibility of the quality of the data produced.
Independent laboratory audits are conducted periodically to ensure the quality of work and data integrity.
Equipment used are periodically maintained, calibrated and qualified as appropriate.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

All the documentation related to the study is archived in a secure place in compliance with the ISO 27001 (both in electronic and paper format).
No significant laboratory events or deviations have occurred during the study that could have impacted the generated results.

3. TEST PROCEDURE

The MN-CPE (Microneutralization based on Cytopathic effect) method is a specific technique used for the identification of virus-specific neutralizing antibodies against live viruses which are able to prevent the virus infection. This assay is a fundamental test in virology, immunology, vaccine assessment and epidemiology studies.

The assay was performed following the VisMederi procedure "WI-MNSARS-CoV-2", and the main phases are described as follows:

- Virus Titration
- Back titration
- Microneutralization

Virus titration

The virus, ten-fold serially diluted in suitable MN medium, was transferred to a plate containing confluent VERO E6 cell monolayers.
After incubation of 3 days the plate was observed under an inverted microscope and the wells were scored as positive/negative for Cytopathic effect (CPE).
The titer was calculated using the Reed-Muench method, obtaining $10^{7.59}$ TCID50/mL as result. The stock virus was then applied in the MN assay at a proper dilution in order to contain 2000TCID50/mL in the working virus solution.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

MN assay

Serum samples were heat inactivated for 30 minutes at 56°C, then two-fold serially diluted starting from 1:10 up to 1:5120 and were mixed with an equal volume of viral solution.

Duplicate runs for each sample were performed in two different plates.

The serum-virus mixture was incubated for 1 hour at 37°C, in a humidified atmosphere with 5% CO_2. After the incubation time, 100 µl of the mixture for each dilution was added in duplicate to a cell plate containing a healthy and sub confluent-to confluent VERO E6 cell lawn and incubated for 3 days in the CO_2 incubator at 37°C and 5% CO_2. The readout was achieved through inverted optical microscopy in order to discriminate wells as positive/negative for Cytopathic effect (CPE).

The Microneutralization titer (MNt) of each titrated sample corresponded to the reciprocal of the highest sample dilution able to protect from CPE at least 50% of the cell monolayer. If no neutralization was observed (MNt <10) an arbitrary value of 5 was reported.

Back titration and reference samples

To verify the virus workload in the solution applied in the assay, the virus working solution was titrated in each MN session. The back titrations performed in both sessions for this study confirmed virus titers within the defined acceptance range of s 47

In addition, each test session included runs of specific reference sera: a positive and a negative serum.

The positive control (PCS) used in every test run, is a human plasma sample collected from a COVID-19 convalescent patient. The sample code TLS-8 was previously tested

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

Document 2

by MN and by ELISA for SARS-CoV-2 antibody titer, providing high positive response confirmed by multiple repetitions.
The negative control sample (NCS) used was a human serum depleted of IgA, IgM and IgG, provided by Sigma Aldrich, cod. S5393 batch 108M4791V.

4. ACCEPTANCE CRITERIA

In agreement with WI-MNSARS-CoV-2, the following internal quality controls have been satisfied in each session of analysis for the Study 20GR142 samples, therefore results were considered reliable and acceptable.

Virus titer evaluation:

- The back titration of the working viral solution lies within the defined target range of s 47

MN results acceptability of each MN plate:

- The cell control (CC) showed a healthy cell monolayer and no evidence of CPE
- The virus control (VC) wells showed cytopathic effect.

MN results acceptability of each sample:

- The duplicate neutralization titers of each serum sample were within a range of s 47

MN results acceptability of each analysis session:

- the positive control sample (PCS) showed a positive titer, in agreement with previous data,
- the negative control sample (NCS) with absent antibody titer showed a negative response.

Since all the acceptability criteria were met, no retest was necessary.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

5. DATA RELEASE

Test results were recorded through dedicated forms, attachments of the VisMederi WI "WI-MNSARS-CoV-2", and transferred in an excel data entry sheet: PFZ_20GR142-WO4_MN-SarsCov2_V2_20200924_GL.xlsx

This report shows the full set of data in Appendix 1 and 2 tables.

Data entry description

The data tables present three sections:

- Sample identification
- Raw Data
- Derived values as geometric mean of duplicate tests

Each subject is identified in a row of table by Sample ID, gender and administered dose of vaccine. Any Study day is showed in following columns as duplicate results "T1A" and "T1B", each one is used for a replicate titer of the same sample. Last columns shows the geometric mean calculated from the two replicate titers for each study visit.

The following table shows geometric mean titers for grouped subjects by sex and for vaccine administered.

Table 1: Overview of GMTs for each dose group, by sampling day and sex

Study Day	Sex	Saline	30µg BNT162b2(V9)	30µg BNT162b3c
PID Day 8 (Day -5)	Male	5	5	5
	Female	5	5	5
Day 17	Male	5	1114	993
	Female	5	2501	1810
RP Day 21 (Day 38)	Male	5	5120	3880
	Female	5	5120	3880
PID = prior to dose initiation; RP = Recovery Phase				

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

Administration of 3 once weekly doses of BNT162b2 (V9) or BNT162b3c elicited SARS-CoV-2 neutralizing antibody responses in males and females at the end of the dosing (Day 17) and recovery phases (Day 21) of the study. SARS-CoV-2 neutralizing antibody responses were not observed in animals prior to vaccine administration or in saline-administered control animals.

GLP COMPLIANCE STATEMENT

This portion of the study was conducted in compliance with Good Laboratory Practice for Nonclinical Laboratory Studies regulations as set forth in the Code of Federal Regulations (21 CFR Part 58) with the exception of the analyses of alpha-1 acid glycoprotein (A1AGP) and alpha-2-macroglobulin (A2M) which were conducted under non-GLP conditions, but according to fit-for-purpose methods. This exception did not have an impact on the integrity or data interpretation of the study.

1. INTRODUCTION

BNT162b2 (Version 9 [V9]) and BNT162b3c are candidate COVID-19 vaccines, which consist of an LNP-encapsulated RNA encoding the SARS-CoV-2 spike protein or its derivatives, were administered by intramuscular (IM) doses once weekly for a total of 3 doses to male and female Wistar Han (Crl:WI[Han]) rats. Animals received the vehicle or test article at doses of 0 or 30 µg RNA/Dose Day followed by a 3-week recovery phase. Group designations and doses are indicated in the table below.

Experimental Design				
Group Number	**Test Article or Vehicle Dose (µg RNA/Dose Day)**	**Dose Volume (µL/injection site)[a]**	**Animal Numbers**	
			Males	**Females**
1	0[b]	60	1-15	46-60
2	30[c]	60	16-30	61-75
3	30[d]	60	31-45	76-90

a. Each animal received a single injection on each dose day.
b. Sterile saline.
c. BNT162b2 (V9).
d. BNT162b3c.

Doses were administered by a single intramuscular injection on each dosing day (60 µL) administered into the left hindlimb quadriceps muscle on Days 1, 8, and 15.

The first 10 animals/sex/group, by ascending animal order, were designated for necropsy at the end of the dosing phase. The remaining animals were retained for the recovery phase.

2. MATERIALS AND METHODS

Clinical laboratory measurements were completed at the Testing Facility (Pfizer DSRD, Groton, CT) and clinical laboratory measurements interpretation was completed at the Test Site (Pfizer DSRD, Pearl River, NY).

2.1. Clinical Laboratory Measurements

Clinical laboratory parameters were evaluated in samples collected from all animals as listed in each section below.

Bone marrow smears were prepared for all animals. Bone marrow smear slides were stained with May-Grunwald Giemsa and were not examined.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

Clinical Pathology Report for Study 20GR142

Schedule for Collection of Samples for Clinical Laboratory Measurements			
Parameter	**Day of Study**		
	Dosing Phase		**Recovery Phase**
	Day 4	Day 17[e]	Day 22
Hematology	X[a,c]	X[c]	X[c]
Coagulation	NA	X[c]	X[c]
Clinical Chemistry (Core Chemistry)	X[b,c]	X[c]	X[c]
Clinical Chemistry (Other Biomarkers – Acute Phase Proteins)/Serum[d]	X[b,c]	X[c]	X[c]
Urinalysis	NA	X	X

NA = Not applicable; X = Scheduled Collection.
a. First 7 animals/sex/group.
b. Last 8 animals/sex/group.
c. Blood samples were collected from animals in a fasted state, with the exception of same day redraws.
d. Assay performed using shared clinical chemistry sample.
e. Evaluated on animals scheduled for necropsy.

Blood Collection			
Parameter	**Collection Condition**	**Approximate Blood Volume**	**Anticoagulant**
Clinical Chemistry	Nonterminal[a, b]	0.7 mL	None-Serum Separator Tube
Clinical Chemistry	Terminal	2.5 mL	None-Serum Separator Tube
Hematology	Nonterminal[a,b]	0.5 mL	K_2EDTA
Hematology	Terminal	2.0 mL	K_2EDTA
Coagulation	Terminal	2.0 mL	3.2% sodium citrate
Biomarkers (Clinical Chemistry)	Nonterminal[a,b]	using shared sample	None-Serum Separator Tube
Biomarkers (Clinical Chemistry)	Terminal	Using shared sample	None-Serum Separator Tube

a. Blood samples were collected under anesthesia.
b. This volume was based on collecting blood for one parameter per group of animals and the other parameter on another group of animals.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

2.1.1. Hematology and Coagulation

Blood samples were analyzed for:

Red Blood Cells (RBC)	Red Cell Distribution Width (RDW)
Hemoglobin (HGB)	Reticulocytes (RETIC)
Hematocrit (HCT)	Platelets (PLT)
Mean Cell Volume (MCV)	Mean Platelet Volume (MPV)
Mean Cell Hemoglobin (MCH)	White Blood Cells (WBC)
Mean Cell Hemoglobin Concentration (MCHC)	White Cell Differential

Blood smears were prepared for the first 7 animals on Day 4 and all animals on Dosing Phase Day 17 and Recovery Phase Day 21 (Groups 1-3).
Blood cell morphology was evaluated microscopically on 5 animals of each sex from all groups at both scheduled necropsies (ie, at dosing and recovery phases).

Blood samples were analyzed for:

Activated Partial Thromboplastin Time (APTT)	Prothrombin Time (PT_Rat)
Fibrinogen (FIB)	

2.1.2. Clinical Chemistry

Core Chemistry

Serum samples were analyzed for:

Alanine Aminotransferase (ALT)	Globulin (GLOB)
Aspartate Aminotransferase (AST)	Albumin/Globulin Ratio (AG)
Alkaline Phosphatase (ALP)	Blood Urea Nitrogen (BUN)
Gamma Glutamyltransferase (GGT)	Creatinine (CREA)
Bilirubin, Total (TBIL)	Phosphorus (PHOS)
Cholesterol (CHOL)	Calcium (CA)
Triglyceride (TRIG)	Sodium (NA)
Glucose (GLUC)	Potassium (K)
Total Protein (TP)	Chloride (CL)
Albumin (ALB)	

Serum indices for hemolysis, icterus, and lipemia were performed.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

Other Biomarkers

Serum Biomarker Sample Collection

Serum samples were analyzed for:

alpha-1-acid glycoprotein (A1AGP)	alpha-2-macroglobulin (A2M)

2.1.3. Urinalysis

Urine samples were collected overnight at scheduled necropsy. Urine samples were analyzed for:

Color	Protein (PRO)
Clarity	Blood
pH	Bilirubin (BIL)
Glucose Urine (GLU)	Specific Gravity (SG)
Ketones (KET)	Volume

Microscopic examination of sediment for formed elements was performed on 5 animals of each sex from all dose groups at both scheduled necropsies (ie, dosing and recovery phases).

2.2. Statistical Analysis

Statistical analyses of hematology, coagulation, clinical chemistry, and urinalysis data was conducted in Pristima. All analyses were performed separately for each sex.

Descriptive statistics were generated for each parameter and group at each scheduled sampling time or each time interval. Statistical tests were conducted at the 5% and 1% significance levels.

Analyses of hematology, coagulation, clinical chemistry, and urinalysis parameters were done on measurements collected for each animal at the scheduled sampling times or time intervals.

A nonparametric (rank-transform) one way analysis of variance (ANOVA) on all groups was conducted, with two-sided pairwise comparisons of Groups 2 and 3 to Group 1 using Dunnett's test. Average ranks were assigned to ties.

3. DATA ACQUISITION

Cerner HNA Millennium Laboratory Information System (Version 2018.01) was used to record clinical laboratory measurement data.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

4. DATA MANAGEMENT AND ARCHIVES

Raw data, documentation, protocol and amendments, final report, and any specimens generated at the Test Facility as the result of the study are retained at Pfizer, Groton, CT.

Materials including raw data and documents electronically archived are retained in the Pfizer OpenLab archive system or locked and retained in the source computerized system, as defined per SOP.

Materials are retained in accordance with the Enterprise Records Retention Schedule.

5. RESULTS

5.1. Clinical Laboratory Measurements

5.1.1. Hematology and Coagulation

Group mean hematology and coagulation data are presented in Table 6. Individual animal hematology and coagulation data are included in Appendix 7. Results indicated below are test article group mean values compared with control group mean values.

Dosing Phase

Test article-related hematology and coagulation findings were similar in rats administered either BNT162b2 (V9) or BNT162b3c and included higher mean white blood cell (WBC) counts and fibrinogen concentrations, lower (Day 4) and higher (Day 17) reticulocyte counts, and lower red blood cell mass (red blood cell [RBC] count, hemoglobin [HGB] and hematocrit [HCT], as represented by HCT in Text Table 1) compared with controls.

Higher WBC primarily involved neutrophils, monocytes and large unstained cells (LUC) but also affected eosinophils and basophils. They were present on Days 4 and 17, with higher counts on Day 17 than Day 4. On Day 17, there were also test article-related higher fibrinogen concentrations in both sexes. Hypersegmented neutrophils were present on peripheral blood smears of test article-treated animals.

In addition, there were test article-related transiently lower reticulocyte counts on Day 4, and higher reticulocytes on Day 17 (females only) with attendant expected changes in RBC indices (higher mean cell hemoglobin concentration [MCHC; males] on Day 4; lower mean cell hemoglobin [MCH] and higher red cell distribution width [RDW] on Day 17; both sexes). These were associated with lower RBC mass on Days 4 & 17 (comparable on both days or slightly lower on Day 17).

Dose (µg RNA/Dose Day)						
Parameter	Males			Females		
Test Article	Vehicle	BNT162b2(V9)	BNT162b3c	Vehicle	BNT162b2(V9)	BNT162b3c
	0	30	30	0	30	30
FIB (mg/dL)						
17D	253.1	2.36x	2.39x	217.2	2.49x	2.59x

Control mean values and the ratio of the test article-related findings relative to control means are listed.
- = Not test article related; BASO = Basophil, absolute; D = Day; EO = Eosinophil, absolute; FIB = Fibrinogen; HCT = Hematocrit; LUC = Large unstained cells, absolute; MCH = Mean cell hemoglobin; MCHC = Mean cell hemoglobin concentration; MONO = Monocyte, absolute; NEUT = Neutrophil, absolute; RDW = Red cell distribution width; RETIC = Reticulocyte, absolute; WBC = White blood cells.

Recovery Phase

All test article related changes were fully reversed after a 3-week recovery period, with the exception of higher RDW (Text Table 2).

Text Table 2. Test Article-Related Hematology and Coagulation Parameter Effects (Mean Control Values and Ratio Relative to Control Mean)

Dose (µg RNA/Dose Day)						
Parameter	Males			Females		
Test Article	Vehicle	BNT162b2(V9)	BNT162b3c	Vehicle	BNT162b2(V9)	BNT162b3c
	0	30	30	0	30	30
RDW (%)						
R22	11.93	1.13x	1.12x	10.80	1.21x	1.23x

Control mean values and the ratio of the test article-related findings relative to control means are listed.
R = Recovery Day; RDW = Red cell distribution width.

Other statistically significant or apparent differences between test article and control group hematology and coagulation parameters were not test article related due to one or more of the following: small magnitude of the difference, inconsistent direction of the difference, and general overlap in magnitude of individual values with controls.

5.1.2. Clinical Chemistry

Group mean clinical chemistry data are presented in Table 7. Individual animal clinical chemistry data are included in Appendix 8. Results indicated below are test article group mean values compared with control group mean values.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

Dosing Phase

Test article-related clinical chemistry findings were similar in rats administered 30 µg RNA/dosing day of either BNT162b2 (V9) or BNT162b3c and included higher mean alpha-1 acid glycoprotein (A1AGP) and alpha-2-macroglobulin (A2M) and lower albumin:globulin (AG) ratios (primarily due to lower albumin with slight contribution from higher globulins) on Days 4 and 17 in both sexes compared with controls (Text Table 3).

AG						
R22	1.76	-	-	1.90	0.91x	-

Control mean values and the ratio of the test article-related findings relative to control means are listed.
- = Not test article related; AG = Albumin/globulin ratio; GLOB = Globulin; R = Recovery Day.

Other statistically significant or apparent differences between test article and control group clinical chemistry parameters were not test article related due small magnitude of the difference and general overlap in magnitude of individual values with controls.

5.1.3. Urinalysis

Group mean urinalysis data are presented in Table 8. Individual animal urinalysis data are included in Appendix 9.

Dosing and Recovery Phases

There were no test article-related findings on urinalysis.

All statistically significant or apparent differences in urinalysis parameters between test article and control group were not test article related due small magnitude of the difference and general overlap in magnitude of individual values with controls.

6. INTEGRATED SUMMARY AND DISCUSSION OF RESULTS

Male and female Wistar-Han rats were administered either BNT162b2 (V9) or BNT162b3c at 30 µg RNA/Dose Day by intramuscular (IM) injection once weekly for 3 weeks, resulting in nonadverse findings in hematology and clinical chemistry parameters compared with control animals.

All clinical pathology findings (type and magnitude) were generally comparable between rats administered BNT162b2 (V9) or BNT162b3c, and consistent with expected immune responses to vaccines or secondary to inflammation. The main findings were present in males and females on Days 4 and/or 17 and included higher acute phase proteins (alpha-1

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

acid glycoprotein [A1AGP; 7.0x – 42x controls], alpha-2-macroglobulin [A2M; 3.3x – 128x] and fibrinogen [2.4x-2.6x]), lower albumin:globulin (AG; 0.90x - 0.82x; primarily due to lower albumin [0.93x – 0.85x] with slight contribution from globulins [1.04x – 1.10x]), and higher WBC (1.28x - 2.95x; primarily involving neutrophils, monocytes and LUC, which typically represent large mononuclear cells). Hypersegmented neutrophils present on peripheral blood smears were considered to be secondary to the robust increases in neutrophil counts and likely related to mobilization of bone marrow storage neutrophils and prolonged neutrophil lifespan in circulation (Ulich et al, 1988). Collectively, these findings were consistent with expected immune responses to vaccines. Microscopic correlates included minimally increased cellularity of hematopoietic cells (primarily myeloid) in the bone marrow and the spleen, minimal to moderate mixed cell inflammation at the injection site and increased cellularity in germinal centers of lymphoid organs.

In addition, there were transiently lower reticulocyte counts on Day 4 (0.44x - 0.27x), and higher reticulocytes on Day 17 (1.20x - 1.31x; females only), with minor lower red cell mass on Days 4 and 17 (HCT; 0.93x - 0.89x). Lower reticulocytes were interpreted to be a transient effect of innate immune responses (Abreu et al, 2018; Brooks et al, 2017; Kim et al, 2014; Wrighting & Andrews, 2006).

All test article related changes were fully reversed after a 3-week recovery period, with the exception of higher RDW in males and females administered BNT162b2 (V9) (1.13x and 1.21x, respectively) and BNT162b3c (1.12x and 1.23x, respectively), higher globulins in males administered BNT162b2 (V9) (1.08x) and females administered BNT162b2 (V9) (1.06x) and BNT162b3c (1.07x), and lower AG ratio in females administered BNT162b2 (V9) (0.91x).

In conclusion, clinical pathology findings in rats administered BNT162b2 (V9) or BNT162b3c were consistent with expected immune responses to vaccines or secondary to inflammation and included higher acute phase proteins (A1AGP, A2M and fibrinogen), higher WBC (primarily neutrophils, monocytes and LUC), lower red blood cell mass and transiently lower reticulocytes.

1. INTRODUCTION

BNT162b2 (Version 9 [V9]) and BNT162b3c are candidate COVID-19 vaccines, which consist of an LNP-encapsulated RNA encoding the SARS-CoV-2 spike protein or its derivatives, were administered intramuscularly (IM) once weekly for a total of 3 doses to male and female Wistar Han (Crl:WI[Han]) rats. Animals received the vehicle or test article at doses of 30 µg RNA/dosing day followed by a 3-week recovery phase. Group designations and doses are indicated in the table below.

Experimental Design				
Group Number	Test Article or Vehicle Dose (µg RNA/Dose Day)	Dose Volume (µL/injection site)[a]	Animal Numbers Males	Females
1	0[b]	60	1-15	46-60
2	30[c]	60	16-30	61-75
3	30[d]	60	31-45	76-90

a. Each animal received a single injection on each dose day.
b. Sterile saline.
c. BNT162b2(V9).
d. BNT162b3c.

Doses were administered by a single intramuscular injection (60 µL) on each dosing day (Days 1, 8, and 15) into the left hindlimb quadriceps muscle.

The first 10 animals/sex/group, by ascending animal order, were designated for necropsy at the end of the dosing phase (Day 17). The remaining animals were retained for the recovery phase.

2. MATERIALS AND METHODS

Necropsy, organ weights, macroscopic examination, tissue collection, tissue processing, and slide preparation were completed at the Testing Facility (Pfizer DSRD, Groton, CT) and microscopic examination and peer review were completed at the Test Site (Pfizer DSRD, Pearl River, NY).

2.1. Postmortem Observations

2.1.1. Euthanasia

Animals were euthanized by gas anesthesia (isoflurane) followed by exsanguination.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

2.1.2. Necropsy

2.1.2.1. Scheduled Necropsy

Animals from the dosing phase were fasted overnight and euthanized on Dosing Phase Day 17, 2 days after the last dose (first 10 animals/sex/group). Animals from the recovery phase were fasted overnight and euthanized on Recovery Phase Day 22 (remaining 5 animals/sex/group). Complete necropsies, tissue collection, organ weights, and macroscopic tissue evaluation were performed on all animals. Necropsy included macroscopic examination of the external surface of the body, the thoracic and abdominal cavities and their contents, and the collection of all protocol-defined tissues.

2.1.3. Organ Weights

Designated organs from animals in Groups 1-3 were weighed at scheduled necropsy. Organ-to-body weight and organ-to-brain weight ratios were calculated.

2.1.4. Tissue Processing

Representative samples of collected tissues were fixed in 10% neutral buffered formalin except for eye with optic nerve attached (Davidson's), and testis and epididymis (modified Davidson's). All tissues processed for slide preparation were stained with hematoxylin and eosin.

2.1.5. Microscopic Examination

For the dosing phase, all tissues (excluding larynx) collected from all dosing phase animals were examined microscopically. For the recovery phase, tissues (bone marrow sternum, joint, liver, draining lymph node, inguinal lymph node, injection site, and spleen) from recovery animals in the control group and test article dose groups were examined microscopically. Microscopic findings were graded on a scale of 1 to 5 as minimal, mild, moderate, marked, or severe; findings not graded were listed as present.

2.1.6. Peer Review

Following completion of the tissue evaluation by the Anatomic Pathologists, a peer review evaluation was performed by another Pfizer Pathologist.

2.2. Statistical Analysis

Statistical analyses of organ weight data were conducted in Pristima with the methods outlined below. All analyses were performed separately for each sex.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

Descriptive statistics were generated for each parameter and group at each scheduled sampling time or each time interval. Statistical tests were conducted at the 5% and 1% significance levels.

Analyses of organ weight parameters were done on measurements collected for each animal at the scheduled sampling times or time intervals. In addition, organ weight to body weight and organ weight to brain weight ratios were analyzed.

A nonparametric (rank-transform) one way analysis of variance (ANOVA) on all groups was conducted, with two-sided pairwise comparisons of Groups 2 and 3 to Group 1 using Dunnett's test. Average ranks were assigned to ties.

3. DATA ACQUISITION

Pristima Preclinical Data Management Suite (Version 7.4.3) was used to record pathology data.

4. DATA MANAGEMENT AND ARCHIVES

Raw data, documentation, protocol and amendments, final report, and any specimens generated at the Test Facility as the result of the study are retained at Pfizer, Groton, CT.

Materials including raw data and documents electronically archived are retained in the Pfizer OpenLab archive system or locked and retained in the source computerized system, as defined per SOP.

Materials are retained in accordance with the Enterprise Records Retention Schedule.

5. RESULTS

5.1. Unscheduled Euthanasia and Deaths

All animals survived until scheduled necropsy.

5.2. Postmortem Observations

5.2.1. Organ Weights

Group mean organ weight data are presented in Table 9. Individual animal organ weight data are included in Appendix 10. Results indicated below are test article group mean values compared with control group mean values.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

Dosing Phase

Test article-related organ weight changes included higher absolute and relative (to body and brain weight) spleen weights in males and females administered BNT162b2 (V9) or BNT162b3c.

Higher group mean absolute and relative spleen weights were noted at 30 µg RNA/dosing day in BNT162b2 (V9) administered males (1.29x – 1.42x) and females (1.55x – 1.62x) and BNT162b3c administered males (1.34x – 1.52x) and females (1.41x – 1.47x) relative to control group means.

Text Table 1. Ratios of Test Article-Related Mean Absolute and Relative (To Body Weight and Brain Weight) Organ Weights Compared with Mean Controls

		Males			Females		
Dose (µg RNA/dosing day)		0	30[d]	30[e]	0	30[d]	30[e]
		Mean	Ratio		Mean	Ratio	
Spleen	Absolute (g)	0.5951	**1.29x**	**1.34x**	0.4382	**1.55x**	**1.41x**
	OW:BW[a]	0.2008	**1.42x**	**1.52x**	0.2202	**1.59x**	**1.47x**
	OW:BN[b]	0.3120	**1.29x**	**1.34x**	0.2353	**1.62x**	**1.43x**
Brain[c]	Absolute (g)	1.9061	1.01x	1.00x	1.8610	0.96x	0.99x
	OW:BW[a]	0.6449	1.10x	1.13x	0.9383	0.98x	1.02x
Terminal BW[c]	Absolute (g)	296.06	0.92x	0.89x	198.73	0.98x	0.97x

BN = Brain weight; BW = Body weight; g = grams OW = Organ weight.
a. Organ weight relative to terminal body weight.
b. Organ weight relative to brain weight.
c. Included for evaluating organ to brain weight and body weight ratios.
d. BNT162b2(V9)
e. BNT162b3c
Bold = test article related.

Recovery Phase

No test article-related organ weight changes were noted for either test article.

The spleen weights (absolute and relative to brain weight) were statistically increased in males administered BNT162b2 (V9). A similar change was not observed in females administered BNT162b2 (V9). A microscopic correlate was not identified in males (ie, no evidence of increased cellularity of hematopoietic cells), although one male had minimally

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

increased cellularity of germinal centers in the spleen. A similar increase in spleen weight was not identified in either males or females administered BNT162b3c. Therefore, the higher spleen weights in recovery males administered BNT162b2 (V9) was considered incidental and unrelated to vaccine administration, consistent with full recovery of the higher spleen weights observed at the end of dosing phase.

Other statistically significant or apparent alterations in mean absolute or relative organ weights were not test article-related because they did not occur in a dose-related pattern, were of low magnitude, lacked a macroscopic or microscopic correlate, occurred only in relative data, or occurred only in absolute data, but lost significance when evaluated relative to brain or body weight.

5.2.2. Macroscopic Findings

An incidence summary of macroscopic observations is presented in Table 10. Individual animal macroscopic observations are included in Appendix 11.

Dosing Phase

Test article-related macroscopic findings included large draining lymph nodes (abnormal size, enlarged) and dark/pale and/or firm injection sites (abnormal color, dark/pale and/or abnormal consistency, firm) in animals administered BNT162b2 (V9) or BNT162b3c, and large spleen and inguinal lymph nodes (abnormal size, enlarged) in animals administered BNT162b3c.

The macroscopic observation of large draining lymph nodes was present in BNT162b2 (V9) administered males and females and BNT162b3c administered females; large inguinal lymph nodes were observed in BNT162b3c administered females; pale/dark injection sites were observed in BNT162b2 (V9) administered males and females and BNT162b3c administered males; and firm injection sites were observed in BNT162b2 (V9) or BNT162b3c administered males and females. The macroscopic observation of enlarged spleen was limited to a single BNT162b3c administered female.

b. BNT162b2(V9).
c. BNT162b3c.

Recovery Phase

Test article-related macroscopic findings observed at the end of recovery phase were limited to large draining lymph nodes (abnormal size, enlarged) in one male administered BNT162b2 (V9) and 1 female administered BNT162b3c and large inguinal lymph nodes (abnormal size, enlarged) in 1 female administered BNT162b3c, indicating a partial recovery of these findings. Pale/dark and/or firm injection sites and enlarged spleen were not observed at the end of recovery phase in BNT162b2 (V9) or BNT162b3c administered males and females, indicating a complete recovery of these findings.

Text Table 3. Group Incidences of Test Article-Related Macroscopic Findings

a. BNT162b2(V9).
b. BNT162b3c.

The remaining macroscopic findings were not test article-related effects because they were consistent with spontaneously occurring findings, the findings were distributed randomly

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

among groups, or their appearance was similar to findings in controls from this and/or previous studies.

5.2.3. Microscopic Findings

An expanded incidence summary of microscopic observations is presented in Table 11. Individual animal microscopic observations are included in Appendix 11.

Dosing Phase

Organs with test article-related microscopic findings included the injection site (mixed cell inflammation and edema), draining and inguinal lymph nodes (increased cellularity, plasma cells and germinal centers), liver (hepatocellular vacuolation), spleen (increased cellularity, hematopoietic cells and germinal centers), and bone marrow (increased cellularity, hematopoietic cells) in both males and females administered BNT162b2 (V9) or BNT162b3c. Inflammation at the injection site and increased cellularity of germinal centers in the lymph nodes were also observed in control animals but the incidence and/or severity was/were low and within the limits of the expected normal response to intramuscular injection of saline in these animals.

Text Table 4. Group Incidences (with Severities) of Test Article-Related Microscopic Findings

- = No finding present.
a. Number examined.
b. BNT162b2(V9).
c. BNT162b3c.

Mixed cell inflammation at the injection site was characterized by large numbers of neutrophils with fewer plasma cells, macrophages, and lymphocytes admixed with abundant pale eosinophilic fluid (edema) and small amounts of cellular debris, fibrin, and hemorrhage. Inflammatory cells frequently infiltrated and expanded the epimysium, perimysium, and endomysium and separated and surrounded the myofibers and/or blood vessels in the skeletal muscle. Occasionally, inflammatory cells extended into the subcutaneous tissue/dermis of the overlying skin and into the extra-capsular tissue of the joint.

Increased cellularity in germinal center was observed in the lymph nodes and spleen compared to controls.

Increased cellularity of plasma cells in the lymph nodes was characterized by infiltration of variable numbers of plasma cells in the cortical, medullary, and subcapsular sinuses. Plasma cells were immature in appearance and were interpreted to likely represent plasmablasts.

Increased cellularity of hematopoietic cells in the bone marrow and spleen was characterized by increased hematopoietic precursor cells (primarily myeloid precursors) within the bone marrow or splenic red pulp compared to controls.

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

Vacuolation of the periportal hepatocytes in the liver was characterized by small clear round membrane bound structures within cytoplasm of these cells.

Recovery Phase

Test article-related microscopic findings noted at the end of the dosing phase including edema at the injection site, hepatocellular vacuolation in the liver, and increased cellularity of hematopoietic cells in the spleen and bone marrow were not observed at the end of recovery phase in BNT162b2 (V9) or BNT162b3c administered males and females, indicating a complete recovery of these findings. Inflammation at the injection site was characterized by mostly lymphocytes and plasma cells with few neutrophils (indicating partial recovery) and no edema (full recovery). However, increased cellularity of plasma cells and germinal centers in the draining and inguinal lymph nodes, and increased cellularity of the germinal centers in the spleen partially recovered, as the incidence and/or severity of these findings were lower in recovery phase animals as compared to dosing phase animals in both males and females administered BNT162b2 (V9) or BNT162b3c. At the end of recovery phase, mature plasma cells had replaced the plasmablasts identified in the inguinal and draining lymph nodes in the dosing phase animals. In recovery phase animals, infiltration of macrophages was observed in the draining lymph nodes (minimal to mild) in both sexes administered BNT162b2 (V9) or BNT162b3c and in the inguinal lymph nodes (minimal) in both sexes administered BNT162b3c. This finding was considered indicative of a reparative process (consequence of phagocytosis), which can be seen following inflammatory reactions at the injection sites.

c. BNT162b3c.

The remaining microscopic findings were not test article-related effects because they were consistent with spontaneously occurring findings, the findings were distributed randomly among groups, or their appearance was similar to findings in controls from this and/or previous studies.

6. INTEGRATED SUMMARY AND DISCUSSION OF RESULTS

BNT162b2 (Version 9 [V9]) and BNT162b3c, candidate COVID-19 vaccines, were administered by intramuscular (IM) doses once weekly for a total of 3 doses to male and female Wistar Han (Crl:WI[Han]) rats at 30 µg RNA/dosing day followed by a 3-week recovery phase.

All test article-related pathology findings with both vaccine candidates were interpreted as nonadverse, as there was no evidence of systemic toxicity or clinical signs of illness or lameness.

At the end of the dosing phase, test article-related mixed cell inflammation (mild to moderate) and edema (mild to moderate) at the injection site were consistent with those typically associated with the IM administration of lipid nanoparticle (LNP)-encapsulated mRNA vaccines (Hassett et al, 2019). These findings correlated with macroscopic observations of abnormal color (dark/pale) and consistency (firm). At the end of the 3-week recovery phase, full recovery occurred for macroscopic findings of pale/dark and firm

090177e195d470f8\Approved\Approved On: 17-Dec-2020 21:42 (GMT)

injection sites and the microscopic finding of edema, whereas partial recovery occurred for inflammation at the injection sites.

At the end of the dosing phase, test article-related findings in the lymph nodes (increased cellularity of plasma cells [minimal to moderate] and germinal centers [minimal to mild]), spleen (increased cellularity of hematopoietic cells [minimal] and germinal centers [minimal]), and the bone marrow (minimal increased cellularity of hematopoietic cells) were secondary to immune activation and/or inflammation at the injection site. The presence of plasma cells (interpreted as plasmablasts) in the draining and inguinal lymph nodes was interpreted to reflect a robust immunological response to the vaccines. These observations correlated with macroscopic observations of abnormal size (enlarged) in the lymph nodes and spleen and increased splenic weights. At the end of the 3-week recovery phase, full recovery occurred for higher spleen weights, macroscopic finding of enlarged spleen, and microscopic findings of increased cellularity of hematopoietic cells in the spleen and bone marrow, whereas partial recovery occurred for macroscopic findings of enlarged draining and inguinal lymph nodes, microscopic findings of increased cellularity of plasma cells and germinal centers in the draining and inguinal lymph nodes, and increased cellularity of the germinal centers in the spleen.

At the end of the dosing phase, test article-related microscopic finding of minimal portal hepatocyte vacuolation was not associated with hepatic tissue damage or liver enzyme alterations. This change might be related to hepatic clearance of the pegylated lipid in the LNP (Ivens et al, 2015). At the end of 3-week recovery phase, this finding was completely recovered.

In conclusion, administration of BNT162b2 (Version 9 [V9]) or BNT162b3c, at 30 µg RNA/dosing day by intramuscular (IM) administration once weekly to Wistar Han rats for 3 weeks did not result in any adverse findings. All test article-related effects were nonadverse, and except for hepatocyte vacuolation, effects were consistent with expected immune responses to vaccines and/or secondary to inflammation. Full or partial recovery occurred in both males and females administered BNT162b2 (V9) or BNT162b3c for all findings by the end of the recovery phase.

COMPLIANCE STATEMENT AND REPORT APPROVAL

Study Number: 513351

Study Title: AZD1222 (ChAdOx1-nCovd-19): A 6 Week Intermittent Dosing Intramuscular Vaccine Toxicity Study in the Mouse with a 4 Week Recovery

The study, with the exception of the stability of the test item and pathology peer review, was performed in accordance with the OECD Principles of Good Laboratory Practice as incorporated into the United Kingdom Statutory Instrument for GLP and as accepted by Regulatory Authorities throughout the European Union, United States of America (FDA and EPA) and Japan (MHLW, MAFF and METI) and other countries that are signatories to the OECD Mutual Acceptance of Data Agreement.

A Compliance Statement from the Principal Investigator for the immunogenicity work conducted at AstraZeneca, Aaron Klug Building, Granta Park, Cambridge, CB21 6GH, UK is presented in Appendix 13.

SEND datasets were not subject to QA Audit nor used as the basis for the Study Director interpretation of the final study results.

Exceptions from the above regulations are listed below.

- Pathology Peer Review
- Stability Assessment of the Test Item

This study was conducted in accordance with the procedures described herein. All deviations authorised/acknowledged by the Study Director are documented in the study records and have no impact on the outcome or integrity of the study. The report represents an accurate and complete record of the results obtained.

2. SUMMARY

AZD1222 is a recombinant, replicant defective adenovirus (ChAdOx1-nCovd-19) expressing the SARS-CoV-2 spike (S) surface glycoprotein which is under development by AstraZeneca as a potential COVID-19 disease prevention vaccine. The objective of this study was to determine the potential toxicity of AZD1222 when given by intramuscular injection intermittently (on Days 1, 22 and 43) to mice, with a 28 day recovery period to evaluate the potential reversibility of any findings. In addition, the immunogenicity was evaluated. Scheduled necropsies were conducted either at the end of the 6 week treatment period (Day 45) or at the end of the 28 day recovery period.

The study design was as follows:

Text Table 1
Experimental Design

Group No.	Treatment	Dose Volume[a] (µL)	Total Viral Particle (VP)/dose
1	Control	70	0
2	AZD1222	70	3.7×10^{10}

[a] 35 µL was administered in the thigh muscle of each hind limb on each dosing occasion (total dose volume = 70 µL [0.07 mL])
Control item = AZD1222 Vehicle (10 mM histidine, 7.5% [v/w] sucrose, 35 mM sodium chloride, 1 mM magnesium chloride, 0.1% [v/w] Polysorbate-80, 0.1 mM EDTA and 0.5% [v/w] ethanol, pH 6.6)

Text Table 2
Number of Animals

Group No.	Main Study		Recovery		Immunogenicity	
	M	F	M	F	M	F
1	20	20	20	20	-	-
2	20	20	20	20	5	5

- = Not applicable, M = Males, F = Females

The following parameters and end points were evaluated in this study: clinical signs, body temperature, body weights, body weight gains, food consumption, dermal scoring, Irwin screen observations, clinical pathology parameters (hematology and plasma chemistry), immunogenicity, gross necropsy findings, organ weights, and histopathological examinations.

In comparison to controls and pre-study data, a slightly higher body temperature was observed in AZD1222 treated males, notably on Days 22, 4 hours post dose (range 36.2-39.5ºC compared to 36.2-38.7ºC in controls) but was comparable to controls by 24 hours post-dose. There was no AZD1222-related change in body temperature recorded in males, as part of the Irwin observations.

In animals administered AZD1222, there was a mild decrease in monocytes on Day 45, which was consistent with expected pharmacology following immunisation. Additionally, globulin was mildly higher, and albumin and albumin/globulin ratio were minimally to mildly lower, which was consistent with an acute phase response. Following the recovery period, globulin remained mildly higher and albumin/globulin ratio remained mildly lower in AZD1222-treated females, the other changes had reversed.

All samples collected from animals during the pretreatment phase prior to immunisation were below the limit of quantification (BLQ) for the assay (BLQ; 0.250 AU/mL) and considered

seronegative. Samples collected indicate that all animals mounted an antibody response to S-glycoprotein following a single administration of AZD1222 on Day 1 with most animals showing a marked increase in the level of antibody response following a second administration of AZD1222 on Day 22. On Day 74, a further increase in antibody response or maintenance of response was observed in all animals following a third administration of AZD1222.

At histopathological examination of the main study animals, mononuclear and/or mixed cell inflammation was observed in the subcutaneous tissue and underlying skeletal muscle at the control and AZD1222 administration sites. This finding was of a higher incidence in animals dosed with AZD1222. In some animals there was an extension of the inflammatory cells into the fascia and connective tissue below the skeletal muscle at the administration sites, that extended to surround the sciatic nerve. The inflammatory cells did not extend into the endoneurium of the sciatic nerve and no findings were present in the underlying axons, which appeared histologically normal. Inflammatory cells were not observed in the nerve roots contained within the lumbar spinal cord sections, confirming that the epineurial/perineurial inflammatory cells noted in the sciatic nerve samples resulted from an extension of the inflammation from the adjacent injection site. There were no findings in the administration sites or sciatic nerves at the end of the recovery period, indicating complete recovery of the AZD1222 related inflammation.

In conclusion, administration of AZD1222 to CD-1 mice (total viral particle dose of $3.7x10^{10}$) by intramuscular injection on 3 occasions (once every 3 weeks) over a 43 day period was well tolerated, with a transiently higher body temperature in males, decreases in monocytes in males and females (consistent with the expected pharmacology of AZD1222) and increase in globulin and decrease in albumin and albumin/globulin ratio, consistent with an acute phase response, observed.

In all animals dosed with AZD1222, antibodies against the S-glycoprotein were raised and maintained throughout the dosing and recovery periods in all animals.

In AZD1222 animals, higher spleen weights were observed but with no correlating macroscopic or microscopic changes. Non adverse, fully reversible, mixed and/or mononuclear cell inflammation was observed in the subcutaneous tissues and skeletal muscle of the administration sites and adjacent sciatic nerve of animals dosed with AZD1222 which were consistent with the anticipated findings after intra-muscular injection of vaccines.

3. INTRODUCTION

AZD1222 is a recombinant, replicant defective adenovirus (ChAdOx1-nCovd-19) expressing the SARS-CoV-2 spike (S) surface glycoprotein which is under development by AstraZeneca as a potential COVID-19 disease prevention vaccine. The objective of this study was to determine the potential toxicity of AZD1222 when given by intramuscular injection intermittently (on Days 1, 22 and 43) to mice with a minimum 28 day recovery period to evaluate the potential reversibility of any findings. In addition, the immunogenicity was evaluated.

The design of this study was based on the study objectives, the overall product development strategy for the test item, and the following study design guidelines:

- ICH Harmonised Tripartite Guideline S7A. *Guideline on Safety Pharmacology Studies for Human Pharmaceuticals*.
- Committee for Medicinal Products for Human Use (CHMP). *Note for Guidance on Repeated Dose Toxicity*. CPMP/SWP/1042/99rev1.
- ICH Harmonised Tripartite Guideline M3 (R2). *Nonclinical Safety Studies for the Conduct of Human Clinical Trials and Marketing Authorisation for Pharmaceuticals.*
- WHO Guideline on Nonclinical Evaluation of Vaccines, Nov 2005, and WHO Guideline on the Nonclinical Evaluation of Vaccine Adjuvants and Adjuvanted vaccines Oct 2013.
- FDA: Guideline for Industry: Considerations for Development Toxicity Studies for Preventive and Therapeutic Vaccines for Infectious Disease Indications 2006, and Development and Licensure of Vaccines to Prevent COVID-19: Guidance for Industry; Center for Biologics Evaluation and Research; June 2020.
- OECD Series on Principles of Good Laboratory Practice and Compliance Monitoring. Number 13. *Consensus Document of the Working Group on Good Laboratory Practice. The Application of the OECD Principles of GLP to the Organisation and Management of Multi-Site Studies*.

Study Initiation Date:	25 August 2020
Initiation of Dosing:	08 September 2020
Completion of In-life:	20 November 2020 (last date of necropsy)
Experimental Starting Date:	01 September 2020
Experimental Completion Date:	30 December 2020

- = Not applicable; M = Male, F = Female

The study was conducted in accordance with the Study Protocol presented in Appendix 1. Deviations to the Study Protocol are presented in Section 4.3.

Text Table 5
Protocol Specifications

Age at Initiation of Dosing	7-8 weeks old
Body Weight Range at Initiation of Dosing	31.0 – 40.4 g males 21.2 – 30.6 g females
Environmental Conditions	Temperature – Target 19-23°C; Actual 19-23°C Humidity – Target 40-70%; Actual 31-67%
Number of Acclimation Days	14 days
Animal Enrichment	In addition to the enrichment items stated in the protocol, nestlets were also provided to the cages.

Text Table 6
Study Events

Event	Impact
Animal F1618 was found dead on Day 39.	As this was a control animal, there were still sufficient data within the group to allow a meaningful toxicological evaluation of AZD1222 and therefore, this was considered to have had no impact on the outcome or integrity of the study.
At dosing on Day 22, part of the dose for Animal M1105 was administered subcutaneously instead of the intramuscular (I/M) route.	As this was a control animal, there was still sufficient data within the group to allow a meaningful toxicological evaluation of AZD1222 and therefore, this was considered to have had no impact on the outcome or integrity of the study.

Event	Impact
The target range for humidity was 40 to 70%, however, the actual range was 31 to 67%.	There were occasions where the target environmental conditions for humidity were not maintained. These occasions were transient, and the health of the animals was unaffected on any occasion, therefore, these excursions were considered not to impact the outcome or integrity of the study.

4.2. Test material identification

Text Table 7
Test Item Identification

	Test Item	Control Item
Identification	AZD1222	AZD1222 Vehicle Buffer
Alternate Identification	ChAdOx-nCovd-19	-
Batch/Lot No.	MS00684-92	BN20-1689
Expiration/Retest Date	07 Aug 2021	24 Feb 2021
Viral Particle Concentration	5.3 x10^{11}/mL	-
Density	1.025 g/cm^3	1.029 g/cm^3
Storage Conditions	Set to maintain -80°C	Set to maintain 4°C
Provided by	Sponsor	Sponsor

- = Not applicable
Control Item; AZD1222 vehicle = 10 mM histidine, 7.5% [v/w] sucrose, 35 mM sodium chloride, 1 mM magnesium chloride, 0.1% [v/w] Polysorbate-80, 0.1 mM EDTA and 0.5% [v/w] ethanol, pH 6.6)

4.3. Protocol deviations

All deviations that occurred during the study have been authorised/acknowledged by the Study Director, assessed for impact, and documented in the study records. All protocol deviations and those SOP deviations that could have impacted the quality or integrity of the study are listed below. Minor SOP deviations that did not impact the quality or integrity of the study have been included at the discretion of the Study Director.

None of the deviations were considered to have impacted the overall integrity of the study or the interpretation of the study results and conclusions.

Exception to GLP

- As detailed in the protocol, the peer review of the pathology data was not conducted in accordance with the principles of GLP. As the pathology evaluation was conducted and peer reviewed by board certified pathologists with significant experience in this field, this was considered to have had no impact on the outcome or integrity of the pathology evaluation or the overall study conclusions.
- As detailed in the protocol, the stability of the test item was not conducted in accordance with the principles of GLP but was conducted according to GMP. The test item formulations were used as supplied from the Sponsor. Prior to dosing, the data supplied was reviewed by the Study Director and considered suitable for use on this study. As the stability of the

formulation was conducted in accordance with GMP, it was considered to have had no impact on the outcome or integrity of the study.

Formulations and Dosing

- The protocol stated that the pre-supplied control item would be removed from the freezer on the morning of dosing, however, on the first two dosing occasions, the control item was instead removed from the refrigerator. As the control item was stored in the refrigerator, the protocol should have stated that it would be removed from the refrigerator, not the freezer. Therefore, this was considered to have no impact on the outcome or integrity of the study as the control item was handled as intended.
- The protocol stated that a reserve sample of the test item would not be retained at the Test Facility, however, a reserve sample of the test item was retained at the Test Facility under a different study that used the same test item. This did not prevent the study objectives from being met and as the sample was not retained under this study, this was considered to have had no impact on the outcome or integrity of the study.

In-life Observations, Measurements, and Evaluations

- On Day 1, the 3 to 4 hours post administration observations for Group 2 animals were recorded up to 7 minutes late. This was considered to be a minimal time deviation and therefore, this was considered to have had no impact on the outcome or integrity of the study.
- On Day 1, the 3 to 4 hours post administration observations for Group 1 animals were not recorded. The animals were free from clinical observations at the previous and subsequent time points. Additionally, the animals had body temperatures and dermal scoring recorded at 4 hours post-dose and so the Study Director was confident that the animals were observed and were free from clinical observations.
- On Day 1, the pre-administration dermal scoring for Site 1 for Animal M2004 was incorrectly recorded as the right leg for erythema, however this should have been recorded as the left leg. This was considered to be a data recording error and the Study Director was confident that the left hindlimb was also assessed and free from erythema and oedema. Therefore, this was considered to have no impact on the outcome or integrity of the study.
- Dermal scoring was recorded for all animals on Day 23 despite this not being required by the protocol. The observation of animals at an additional time point did not prevent the study objectives from being met and therefore, this was considered to have no impact on the outcome or integrity of the study.
- The protocol stated that the dermal scoring procedure would be conducted at 4 hours post each dosing occasion, however, on several occasions throughout the study, this was recorded up to 32 minutes early and/or up to 9 minutes late. These were generally considered to be minimal time deviations and did not prevent a meaningful evaluation of this data set and therefore, this was considered to have had no impact on the outcome or integrity of the study.
- The recovery and immunogenicity animals had an additional body weight collected on Day 46, in error. This additional data did not prevent the study objectives from being met and therefore, this was considered to have had no impact on the outcome or integrity of the study.

- The immunogenicity animals did not have food consumption recorded throughout the recovery period in error. As food consumption was measured in recovery animals throughout this period, there was sufficient data to allow a meaningful evaluation of this data set and therefore, this was considered to have had no impact on the outcome or integrity of the study.
- On Day 22 for one control male, food consumption was not calculable due to a food recording error. As there was sufficient data within the group to allow a meaningful analysis of the data, this was considered to have had no impact on the outcome or integrity of the study.
- The Day 1, 24 hour (±1 hour) body temperature for AZD1222-treated males were recorded up to 1 hour and 15 minutes outside the protocolled allowance. This did not prevent a meaningful evaluation of this data set and therefore, this was considered to have had no impact on the outcome or integrity of the study.

Postmortem and Pathology

- The Study Director issued a signed instruction that detailed the order in which the animals should be euthanised, however, at the main study necropsy, one animal was killed out of the specified order and at the recovery necropsy, 5 animals were killed out of the specified order. Animals were rotated across the groups and sexes throughout the day and this did not prevent the study objectives from being met, therefore this was considered to have no impact on the outcome or integrity of the study.
- On Day 74, both ovaries for Animal F1601 were lost at necropsy prior to a weight being collected and they were therefore not available for histopathological evaluation. There was still sufficient data within the group to allow a meaningful analysis of the data set and therefore, this was considered to have had no impact on the outcome or integrity of the study.
- The protocol stated that the immunogenicity animals would be euthanised by an approved method, however, there is no positive confirmation of the method of euthanasia within the study data. At the Test Facility, the only methods of euthanasia are approved methods and so the Study Director is confident an approved method was used despite the lack of positive confirmation of this. There were no terminal procedures on these animals and therefore, this was considered to have had no impact on the outcome or integrity of the study.

Statistical Analysis

- Body temperature was incorrectly omitted from the statistical analysis section of the protocol; however, these analyses were performed. Data were scheduled to be collected, with the intention to analyse the data as is standard on this data type. As the intention of the study was carried out as planned, this deviation is deemed to have had no impact on the integrity or outcome of the study.

5. COMPUTERISED SYSTEMS

Critical computerised systems used in the study are listed below or presented in the appropriate Phase Report. All computerised systems used in the conduct of this study have been validated.

Text Table 8
Critical Computerised Systems

System Name	Version No.	Description of Data Collected and/or Analysed
Provantis®	10	Applicable in-life, clinical pathology and postmortem
Dispense	10	Test item receipt, accountability and formulation activities.
MSD SECTOR S 600	Asset number 200034966	Immunogenicity
MSD Analysis Software	4.0.12	Immunogenicity
Devil Information Library	2.1	Study deviations
Share Document Management System (SDMS)	1.0	Reporting
DocuSign™	19	Collection of 21 CFR Part 11 Compliant signatures
Vaisala/Trend 963 Secure	1.22	Continuous temperature and humidity recording. Alarms for animal rooms, refrigerators, freezers and incubators.
eSlide manager	12.4.3.7006	Histopathology peer review

6. RETENTION OF RECORDS, SAMPLES, AND SPECIMENS

All study-specific raw data, documentation, protocol, protocol amendments, samples, specimens, and Final Reports from this study were archived at the Test Facility, unless otherwise stated below. Three years after issue of the Final Report, the Sponsor will be contacted.

On completion of the immunogenicity phase, all raw data and study related documents generated during this phase of this study, including a copy of the Phase Plan (and all associated amendments), and Final Phase Report, will be stored initially in the archives at AstraZeneca, Cambridge, UK. Periodically records will be transferred to an off-site contract archive facility, Qualogy (UK) as per the Global Retention and Destruction (GRAD) schedule.

Study samples are stored initially in Integrated Bioanalysis laboratory at AstraZeneca, Cambridge, UK. Periodically material may be transferred to an off-site contract archive facility, Cryostore, UK for a period of at least 2 years or as stated in the Study Protocol. Electronic data generated by the Test Facility were archived as noted above, except that the data collected using Provantis and Dispense, reporting files stored on SDMS, and study deviations recording on Devil Information Library were archived at the Charles River Laboratories facility location in Wilmington, MA, USA.

7. RESULTS AND DISCUSSION

7.1. Mortality

(Appendix 2)

Control animal F1618 was found dead on Day 39. There were no clinical observations or erythema/oedema noted at the injection sites in this animal throughout the study and there were no changes in body weight. As this is a control animal, this was considered to be unrelated to administration AZD1222. Many tissues showed post-mortem changes but there were no microscopic findings that would account for the death of this animal.

7.2. Clinical observations

(Table 1 and Appendix 3)

There were no clinical observations that were considered to be related to administration of AZD1222.

Erect fur was observed in all male animals, including controls and in the majority of AZD1222 females throughout the dosing period. In females, this had recovered by Day 25, however, was observed throughout the duration of the dosing period in males. As this was also observed in control animals, it was considered unrelated to administration of AZD1222. Additionally, there were isolated instances of increased activity, eyeball opacity, protruding eyeballs, pale pinnae, hunched posture and repetitive behaviour throughout the study, however, these were either observed at a similar incidence in control and AZD1222 treated animals, a higher incidence in control animals or observed in control animals only and therefore were considered unrelated to administration of AZD1222.

7.3. Body temperatures

(Table 2 and Appendix 4)

Following administration of AZD1222, in comparison to control and pre-study data, a slightly higher body temperature was observed in males on Day 1 and also Day 22, 4 hours post dose. This increase was statistically significant on Day 22 (at 4 hours post dose), with AZD1222 group mean body temperatures of 38.25°C (36.2-39.5°C) compared to 36.98°C (36.2-38.7°C) in the control group. Body temperature was comparable to controls by 24 hours post each dosing occasion. It should be noted that there was individual variability in the body temperature with various individual animals, including controls, showing an increase/decrease in temperature values at the measured intervals. There was no AZD1222-related change in body temperature recorded in males, as part of the Irwin observations (see Section 7.7 and Appendix 10).

In females, there were no changes in body temperature that were considered to be related to administration of AZD1222.

7.4. Body weights and body weight gains

(Figure 1, Table 3, Table 4, Appendix 5, Appendix 6 and Appendix 7)

There were no changes in body weight that were considered to be related to administration of AZD1222. Any changes observed were considered to be due to natural variation and/or were observed during pretreatment and/or in control animals.

7.5. Food consumption

(Table 5 and Appendix 8)

There were no changes in food consumption that were considered to be related to the administration of AZD1222.

7.6. Dermal scoring

(Appendix 9)

There was no erythema or oedema at the injection sites after administration of AZD1222 on any dosing occasion.

7.7. Irwin observations

(Appendix 10)

Following intramuscular administration of AZD1222 at a viral particle dose of 3.7 $x10^{10}$, there were no effects on body temperature, pupil size or Irwin observations, when assessed in males on Day 8 and 29 of the study.

7.8. Haematology

(Table 6 and Appendix 11)

AZD1222-related changes in haematology parameters were limited to a mild decrease in monocytes for males (0.43x) and females (0.39x; statistically significant) on Day 45 that was consistent with expected pharmacology following immunisation. Following a 4-week recovery period, there were no AZD1222-related changes in haematology parameters indicating reversibility of findings noted in the main study animals.

Remaining differences in haematology parameters, none of which attained statistical significance, were considered not AZD1222 related and were attributed to biological variation as similar variations were seen in control values, and/or were of a magnitude of change commonly observed in mice under similar study conditions.

7.9. Plasma chemistry

(Table 7 and Appendix 12)

In comparison with controls, globulin was mildly higher, and albumin and albumin/globulin ratio were minimally to mildly lower in AZD1222-treated males and females on Day 45 that may suggest an acute phase response. Following a 4-week recovery period, globulin remained mildly higher and albumin/globulin ratio remained mildly lower in AZD1222-treated females.

In AZD1222-treated females, creatinine was higher for F2512 and F2513, and F2518. These changes were considered not AZD1222-related due to the low incidence and lack of similar changes in males, and lack of changes in other plasma chemistry parameters.

Text Table 9
AZD1222-related Plasma Chemistry Changes

AZD1222	0		$3.7x10^{10}$	
Sex	**M**	**F**	**M**	**F**
Day 45				
Globulin (g/L)	17.90	15.26	1.19***	1.22**
Albumin (g/L)	31.29	34.85	0.94*	0.90**
Day 74 (recovery period)				
Globulin (g/L)	-	12.95	-	1.19*

Numerical values indicate fold changes of treated group mean value relative to the respective control group mean value.
*Indicates statistical significance $p < 0.05$; ** indicates statistical significance $p < 0.01$; *** indicates statistical significance $p < 0.001$.
- Not applicable

Remaining differences in plasma chemistry parameters, some of which attained statistical significance, were considered not AZD1222 related and were attributed to biological variation as similar variations were seen in control values, and/or were of a magnitude of change commonly observed in mice under similar study conditions.

7.10. Immunogenicity

(Figure 2, Figure 3, Figure 4, Table 8 and Appendix 13)

Mouse serum samples were analysed for the determination of antibodies against the S-glycoprotein raised in response to immunisation with AZD1222.

All samples collected from animals during the pretreatment phase prior to immunisation were below the limit of quantification (BLQ) for the assay (BLQ; 0.250 AU/mL) and considered seronegative.

Antibody response is summarised in Text Table 10.

Text Table 10
Immunogenicity Response: Antibody Concentration (AU/mL)

Day	Males	Females	Males and Females Combined
Day 22			
Mean	372.405	816.330	594.367
SD	305.966	567.711	489.480
Day 43			
Mean	993.835	1636.206	1315.020
SD	812.896	1178.415	1012.667
Day 74 (recovery period)			
Mean	1240.280	2477.321	1858.800
SD	827.750	2089.539	1634.049

Samples collected on Day 22 indicate that all animals mounted an antibody response to S-glycoprotein following a single administration of AZD1222 on Day 1. Day 43 samples indicated a marked increase in the level of antibody response for most animals following a second administration of AZD1222 on Day 22.

On Day 74, a further increase in antibody response or maintenance of response was observed in all animals following a third administration of AZD1222.

7.11. Gross pathology

(Table 11 and Appendix 17)

Main Study Animals

No AZD1222-related gross findings were noted.

Gross findings (dark discoloration) seen at administration site 2 were considered incidental to the injection procedure and/or were of similar incidence in control and animals administered AZD1222 and, therefore, were considered to be procedural and unrelated to administration of AZD1222.

The gross finding observed in the liver of one female administered AZD1222 was of the nature commonly observed in this strain and age of mouse and, therefore, was considered unrelated to administration of AZD1222.

Gross findings are summarised in Text Table 11.

Text Table 11
Salient Gross Findings Main Study

Study Phase	**Main**			
Viral Particle (VP)/dose	**0**	**3.7 x 10^{10}**	**0**	**3.7 x 10^{10}**
Sex	**Males**		**Females**	
Number of animals	**20**	**20**	**20**	**20**
Liver (No. examined)	(20)	(20)	(20)	(20)
Prominent lobular architecture	0	0	0	1
Site Admin, 2 (No. examined)	20	20	20	20
Discoloration, dark	1	2	0	1

Recovery Animals

No AZD1222-related gross findings were noted.

All gross findings observed were of the nature commonly observed in this strain and age of mouse and, therefore, were considered unrelated to administration of AZD1222.

7.12. Organ weights

(Table 9, Table 10, Appendix 14, Appendix 15 and Appendix 16)

Main Study Animals

There was a test item-related higher spleen weight in both sexes, but with no correlating macroscopic or microscopic findings. Organ weight changes are summarised in Text Table 12.

Text Table 12
Salient Organ Weight Data

Study Phase	**Main**			
Sex	**Males**		**Females**	
Viral Particle (VP)/dose	**0**	**3.7 x 10^{10}**	**0**	**3.7 x 10^{10}**
Number of animals	**20**	**20**	**20**	**20**
Mean Terminal Body Weight (No. weighed)	20	20	20	20
Group mean value (g)	37.40	39.01*	29.70	30.44
Spleen (No. weighed)	(20)	(20)	(20)	(20)
Absolute value (g)	0.0910	0.1215***	0.1227	0.1738***
Relative to body weight (%)	0.24370	0.31106***	0.41039	0.56592***

Significantly different from control group 1 value Anova & Dunnett: * = $p \leq 0.05$, *** = $p \leq 0.001$.

Other differences in organs weights were considered unrelated to administration of AZD1222.

Recovery Animals

The test item related higher weight seen in the spleens of main study animals was not present in recovery animals.

Other differences in organs weights were considered unrelated to administration of AZD1222.

7.13. Histopathology

(Table 12, Appendix 17, Appendix 18 and Appendix 19)

Main Study Animals

Minimal subcutaneous oedema was observed in the administration sites in male and female animals from both the control group and those administered AZD1222 and was considered to be related to the route of administration.

Minimal mononuclear or mixed cell inflammation was observed in the subcutaneous tissue and underlying skeletal muscle at the administration sites in both male and female animals. This finding was of a higher incidence in animals administered with AZD1222.

In some animals there was an extension of the inflammatory cells into the fascia and connective tissue below the skeletal muscle at the administration sites. This resulted in inflammatory cells being noted surrounding the epineurium/perineurium of the sciatic nerve samples. This finding was recorded as ‘Inflammation perineurium’ in the histopathology data. While sciatic epineurial/perineurial inflammatory cells were present in a small number of controls, the incidence was higher in animals administered AZD1222, and reflected the higher incidence of inflammatory cells noted at the injection sites of animals administered AZD1222. The epineurial/perineurial inflammatory cells did not extend into the endoneurium, and no findings were present in the underlying axons, which appeared histologically normal. Inflammatory cells were not observed in the nerve roots contained within the lumbar spinal cord sections, confirming that the epineurial/perineurial inflammatory cells noted in the sciatic nerve samples resulted from an extension of the inflammation from the adjacent injection site. In the hind limb,

inflammation around the sciatic nerve due to local extension from the administration site is a well-recognized effect (Sellers, 2019).

Histopathology findings are summarised in Text Table 13.

Text Table 13
Salient Microscopic Findings in the Administration Sites of Main Study Animals

Study phase	**Main**			
Viral Particle (VP)/dose	**0**	**3.7 x 10^{10}**	**0**	**3.7 x 10^{10}**
Number of animals	**10**	**10**	**10**	**10**
Sex	**Males**		**Females**	
Administration site 1 (No. examined)	(10)	(10)	(10)	(10)
Inflammation, subcutaneous tissue; myofiber, minimal	2	10	1	10
Mononuclear cell	2	6	0	3
Mixed cell	0	4	1	7
Oedema, subcutaneous, minimal	8	9	7	5
Haemorrhage, subcutaneous, minimal	0	0	0	1
Administration site 2 (No. examined)	(10)	(10)	(10)	(10)
Inflammation, subcutaneous tissue; myofiber, minimal	4	10	1	9
Mononuclear cell	4	6	0	1
Mixed cell	0	4	1	8
Oedema, subcutaneous, minimal	9	9	10	4
Haemorrhage, subcutaneous, minimal	2	2	0	2
Congestion, subcutaneous, minimal	1	0	0	0
Sciatic Nerve (No. examined)	(10)	(10)	(10)	(10)
Inflammation, perineurial, minimal	0	9	2	9
Mononuclear cell	0	5	0	1
Mixed cell	0	4	2	8

The inflammation observed at the administration sites was of the nature commonly observed following intra-muscular injection of a vaccine (Greaves, 2013) in this strain and age of mouse, and was considered non-adverse.

The small number of protocol-required tissues that could not be examined were spread throughout the treatment groups and therefore considered not to have impacted the quality or integrity of the study.

The remaining histopathology findings were considered unrelated to administration of AZD1222.

Recovery Animals

There were no histopathology findings considered related to the administration of AZD1222.

There were no findings in the administration sites or sciatic nerves in the recovery animals, indicating complete recovery of the AZD1222 related inflammation.

8. CONCLUSION

In conclusion, administration of AZD1222 to CD-1 mice (total viral particle dose of $3.7x10^{10}$) by intramuscular injection on 3 occasions (once every 3 weeks) over a 43 day period was well tolerated, with a transiently higher body temperature in males, decreases in monocytes in males and females (consistent with the expected pharmacology of AZD1222) and increase in globulin and decrease in albumin and albumin/globulin ratio, consistent with an acute phase response, observed.

In all animals dosed with AZD1222, antibodies against the S-glycoprotein were raised and maintained throughout the dosing and recovery periods in all animals.

In AZD1222 animals, higher spleen weights were observed but with no correlating macroscopic or microscopic changes. Non adverse, fully reversible, mixed and/or mononuclear cell inflammation was observed in the subcutaneous tissues and skeletal muscle of the administration sites and adjacent sciatic nerve of animals dosed with AZD1222 which were consistent with the anticipated findings after intra-muscular injection of vaccines.

Appendix 1

SUMMARY OF CHANGES AND JUSTIFICATIONS

Protocol effective date: 25 Aug 2020

Note: When applicable, additions are indicated in underlined text and deletions are indicated in strikethrough text directly in the affected sections of the document.

Item or Section(s)	Justification
Amendment 1	**Date: 03 Sep 2020**
5.2. Sponsor	To clarify that inspections of the immunogenicity phase will be study based.
9.1. Test Item(s)	To include test item details on receipt of the test item and associated paperwork.
9.2. Control Item Components	To include control item details on receipt of the control item and associated paperwork.
14. Experimental Design 14.3. Justification of Route and Dosage Levels	To update viral particle concentration to match test item documentation.
16.2.1. Immunogenicity Sample Collection	Clarification that serum separator tubes will be used for the immunogenicity bleeds to improve a serum yield.
Amendment 2	**Date: 07 Sep 2020**
4. Regulatory Compliance	The stability of the test item has not currently been conducted in accordance with the principles of GLP and therefore an exception to the GLP has been documented for the time being. The intention is to retrospectively perform the stability and concentration assessment of the test item at a later date, after which the exception to GLP will be removed (assuming the appropriate stability is determined).
9.2. Control Item Components	Clarification that the control item will be stored in a refrigerator set to maintain 2-8°C, not 4°C.
9.4. Analysis of Test Item	Information added to clarify that the stability of the test item was not conducted in accordance with the principles of GLP and therefore, will be dispensed on the morning of dosing. The intention is to retrospectively perform the stability and concentration assessment of the test item at a later date, after which the exception to GLP will be removed (assuming the appropriate stability is determined).
14.1. Administration of Test and Control Items	Clarification that the doses will be administered to the thigh of the hindlimb.
Amendment 3	**Date: 09 Sep 2020**
15.3. Body Temperature	Based on review of the Day 1, 4 hour post dose body temperature a body temperature will be collected at 24 hours post the first dose and on Day 22, pre-dose, 4 and 24 hours post dose.
Amendment 4	**Date: 02 Oct 2020**
8. Responsible Personnel	To document the change in Clinical Pathology Reviewer.
11.1. Preparation of Control Item	In error, the protocol stated that the control item would be removed from the freezer, however, this should have stated refrigerator. Additionally, the control item name had been added to the preparation section.
Amendment 5	**Date: 15 Oct 2020**
2. Proposed Study Schedule	In discussion with the Sponsor, reporting timelines amended.
8. Responsible Personnel	In discussion with the Sponsor, the immunogenicity data will be interpreted by a scientist at the Test Facility. Section updated accordingly.

Appendix 1

Item or Section(s)	Justification
17.5. Tissue Collection and Preservation	Instruction for the gallbladder to be collected and evaluated microscopically added as this was missing in error.
Amendment 6	**Date: 21 Oct 2020**
17.5. Tissue Collection and Preservation	Clarification that the gallbladder will be collected and weighed with the liver. Clarification that the right and left hindlimbs will be collected at necropsy. In discussion with the Sponsor, the dorsal root ganglion will be collected at necropsy and therefore, has been added to the tissue collection list.
23. Reporting	To update standard wording as the report will now be electronically signed.
Amendment 7	**Date: 27 Oct 2020**
17.5. Tissue Collection and Preservation	Clarification that the sections of the spinal cord will be processed in situ.
20.2. Statistical Analysis	Clarification that haematology and clinical chemistry data will be statistically analysed.
Amendment 8	**Date: 04 Nov 2020**
18.2. Histopathology 18.3. Pathology Peer Review 19. Computerised Systems 22. Retention of Records, Samples and Specimens	To document the usage of Whole Slide Imaging (WSI) in histopathological evaluation.
24.1. Home Office Project Licence No.	The project licence for the toxicity of Pharmaceuticals was recently renewed at the Test Facility and therefore, the study protocol has been updated to reflect the new project licence and project licence protocol number. The updated project licence is effective from 04 Nov 2020.
Amendment 9	**Date: 23 Nov 2020**
6. Communication	To update the communication email at request of the Sponsor.
16.2.3. Immunogenicity Sample Analysis	Analytical information added for the immunogenicity samples and clarification that the data will be interpreted by a scientist at the test facility.
Attachments	To add the immunogenicity bioanalysis phase plan as an attachment.
Amendment 10	**Date: 24 Nov 2020**
16.2.3. Immunogenicity Sample Analysis	To update wording at the request of the sponsor to clarify how the data will be presented.
Attachments	The phase plan in attachment 1 has been included as a PDF attachment rather than a word document attachment (as in the previous amendment) for formatting purposes.
Amendment 11	**Date: 04 Dec 2020**
4. Regulatory Compliance	The stability of the test item (which was used as supplied) has now been generated in compliance with the principles of GLP. Therefore, the exception to GLP ha been removed from the protocol. The stability data, which was generated in compliance with the principles of GLP, was provided to the study director and is retained in the study data.
8. Responsible Personnel	To document the PI's reference number for the immunogenicity phase of the study.
9.4. Analysis of Test Item	The stability of the test item (which was used as supplied) has now been generated in compliance with the principles of GLP. Therefore, the exception to GLP ha been removed from the protocol. The stability data,

Appendix 1

Item or Section(s)	Justification
	which was generated in compliance with the principles of GLP, was provided to the study director and is retained in the study data.
19. Computerised Systems	To document the computerised systems for the immunogenicity phase of the study.
Amendment 12	**Date: 08 Dec 2020**
4. Regulatory Compliance 9.4. Analysis of Test Item	In error, the previous amendment removed the non-compliance for the stability of the test item. This occurred as when reviewing the updated stability memo, the Study Director incorrectly read that this was done to GLP, however, the stability data was generated in accordance with GMP. Section 9.4 has been updated to include information that the stability was performed in accordance with GMP.
Amendment 13	
15.7. Irwin Screen Observations	Clarification that the Irwin screen performed was not modified and this was titled incorrectly in the original protocol. As the protocol and final amendment is presented in the final report, this is being updated for clarity.

Appendix 1

1. OBJECTIVE(S)

AZD1222 is a recombinant, replicant defective adenovirus (ChAdOx1 nCov-19) expressing the SARS-CoV-2 spike (S) surface glycoprotein which is under development by AstraZeneca as a potential COVID-19 disease prevention vaccine. The objective of this study is to determine the potential toxicity of AZD1222 when given by intramuscular injection intermittently (on Days 1, 22 and 43) to mice with a minimum 28 day recovery period to evaluate the potential reversibility of any findings. In addition the antibody response will be evaluated.

1.1. Study Classification

Study Category:	Toxicology
Study Type:	Repeat Dose Toxicity
Study Design:	Parallel
Primary Treatment CAS Registry Number:	Not Available
Primary Treatment Unique Ingredient ID:	Not Available
Class of Compound:	Not Available

2. PROPOSED STUDY SCHEDULE

Proposed study dates are listed below. Actual applicable dates will be included in the Final Report.

Experimental Start Date:	01 Sep 2020 (First date of study-specific data collection)
Experimental Completion Date:	Jan 2021 (Last date data are collected from the study)
Animal Arrival/Transfer:	25 Aug 2020
Initiation of Dosing:	08 Sep 2020
Completion of In-life:	
Main Study:	22 Oct 2020
Recovery:	20 Nov 2020 (Dates of necropsy)
Immunogenicity Sample Despatch:	Delivery 1: 30 Sep 2020 Delivery 2: 21 Oct 2020 Delivery 3: 23 Nov 2020
Clinical Pathology Review (Main Study):	05 Nov 2020 (10 business days from first necropsy)
Clinical Pathology Review (Recovery):	04 Dec 2020 (10 business days from last necropsy)

Appendix 1

Audited Draft Immunogenicity Report:	08 Dec 2020 (11 business days from necropsy)
Irwin Measurements Draft Report:	10 Dec 2020 (45 business days from the Day 29 Irwin measurement)
Main Study Pathology Draft Report and Slides Available for Sponsor Peer Review:	27 Nov 2020 (26 business days from first necropsy)
Scanning of Main Study Pathology Slides for Peer Review:	27 Nov 2020 (26 business days from first necropsy)
Pathology Draft Report (Main Study only) After Sponsor Peer Review:	04 Dec 2020 (31 business days from first necropsy)
Full Pathology Draft Report (including recovery) and Slides Available for Sponsor Peer Review:	24 Dec 2020 (24 business days from last necropsy)
Scanning of Recovery Pathology Slides for Peer Review:	24 Dec 2020 (24 business days from last necropsy)
Pathology Draft Report after Sponsor Peer Review:	31 Dec 2020 (27 business days from last necropsy)
Unaudited Draft Report (Excluding Recovery Pathology/Immunogenicity):	08 Dec 2020 (11 business days from last necropsy)
Receipt of Sponsor Comments (Unaudited Draft):	09 Dec 2020 (12 business days from last necropsy)
Audited Draft Report (Excluding Recovery Pathology):	11 Dec 2020 (15 business days from last necropsy)
Receipt of Sponsor Comments (Audited Draft):	24 Dec 2020
Audited Draft Report (Including Recovery Pathology):	08 Jan 2021 (31 business days from last necropsy)
Finalization of Immunogenicity and Irwin Phase Reports:	23 Dec 2020 (23 business days from last necropsy)
Finalization of Pathology Phase Reports and final set of Sponsor Comments:	13 Jan 2021 (34 business days from last necropsy)

Appendix 1

Final Report:	22 Jan 2021 (40 business days from last necropsy) (Expected date of Study Director signature)

* Main study pathology may not be audited at this stage, Study Director will confirm with Sponsor on issue of report.

3. GUIDELINES FOR STUDY DESIGN

The design of this study was based on the study objective(s), the overall product development strategy for the test item, and the following study design guidelines:

- ICH Harmonised Tripartite Guideline S7A. *Guideline on Safety Pharmacology Studies for Human Pharmaceuticals*.
- Committee for Medicinal Products for Human Use (CHMP). *Note for Guidance on Repeated Dose Toxicity*. CPMP/SWP/1042/99rev1.
- ICH Harmonised Tripartite Guideline M3 (R2). *Nonclinical Safety Studies for the Conduct of Human Clinical Trials and Marketing Authorisation for Pharmaceuticals.*
- WHO Guideline on Nonclinical Evaluation of Vaccines, Nov 2005, and WHO Guideline on the Nonclinical Evaluation of Vaccine Adjuvants and Adjuvanted vaccines Oct 2013.
- FDA: Guideline for Industry: Considerations for Development Toxicity Studies for Preventive and Therapeutic Vaccines for Infectious Disease Indications 2006, and Development and Licensure of Vaccines to Prevent COVID-19: Guidance for Industry; Center for Biologics Evaluation and Research; June 2020.
- OECD Series on Principles of Good Laboratory Practice and Compliance Monitoring. Number 13. *Consensus Document of the Working Group on Good Laboratory Practice. The Application of the OECD Principles of GLP to the Organisation and Management of Multi-Site Studies*.

4. REGULATORY COMPLIANCE

This study will be performed in accordance with the OECD Principles of Good Laboratory Practice as incorporated into the United Kingdom Statutory Instrument for GLP and as accepted by Regulatory Authorities throughout the European Union, United States of America (FDA and EPA) and Japan (MHLW, MAFF and METI), and other countries that are signatories to the OECD Mutual Acceptance of Data Agreement.

Exceptions to GLP include the following:

- Pathology Peer Review
- Stability testing of the test item

Appendix 1

5. QUALITY ASSURANCE

5.1. Test Facility

The Test Facility Quality Assurance Unit (QAU) will monitor the study to assure the facilities, equipment, personnel, methods, practices, records, and controls are in conformance with Good Laboratory Practice regulations. The QAU will review the protocol, conduct inspections at intervals adequate to assure the integrity of the study, and audit the Final Report to assure that it accurately describes the methods and standard operating procedures and that the reported results accurately reflect the raw data of the study.

The Test Facility QAU contact for this study is indicated below:

s 22

5.2. Sponsor

The conduct of the following study phase(s) will be audited by the Sponsor QAU(s):

- Immunogenicity

Inspections will be study based and performed per Test Site SOP. For all study phases inspected by Sponsor or Sponsor subcontractor QAU(s), copies of each periodic inspection report will be made available to the Study Director, Test Facility Management and Test Facility QAU.

6. COMMUNICATION

The Study Director will send an electronic version of the study plan (Final Protocol) and any amendments (signed by the Study Director and, when applicable, Test Facility Management) to the Sponsor Representative (Study Monitor), Alternative Sponsor Contact, Clinical Pathology Reviewer (if applicable), s 22 s 22 , s 22 and to each Monitoring Scientist.

Individual Scientists (IS) at Test Facility

Pathology

Irwin Measurements

Each IS is required to report any deviations or other circumstances that could affect the quality or integrity of the study to the Study Director in a timely manner. Each IS will provide a report addressing their assigned phase of the study, which will be included as an appendix to the Final Report. The phase report will include the following:

- A listing of critical computerised systems used in the conduct and/or interpretation of the assigned study phase

Principal Investigators (PI) at Test Site

Immunogenicity

The PI's reference number for this phase of the study is 2020-AZD1222-0217.

Each PI is required to report any deviations or other circumstances that could affect the quality or integrity of the study to the Study Director in a timely manner. Each PI will provide a report addressing their assigned phase of the study, which will be included as an appendix to the Final Report. A draft of the phase report will be submitted to the Study Director for review prior to finalisation. The phase report will include the following:

- A Statement of Compliance
- A QA Statement
- The archive site for all records, samples, specimens and reports generated from the phase or segment (alternatively, details regarding the retention of the materials may be provided to the Study Director for inclusion in the Final Report)

Appendix 1

9. TEST AND CONTROL ITEMS

9.1. Test Item(s)

Identification: AZD1222

Alternative Identification: ChAdOx1-nCovd-19

Supplier: AstraZeneca

Batch (Lot) Number: MS00684-92

Appendix 1

Date of Manufacture: 07 Aug 2020

Expiration Date: 07 Aug 2021

Viral Particle Concentration: 5.3 x10^11/mL

Storage Conditions: In a freezer at approximately -80°C.

Administration Dose Form: Solution

9.2. Control Item Components

Identification: AZD1222 Vehicle

Composition: 10 mM histidine, 7.5% (v/w) sucrose, 35 mM sodium chloride, 1 mM magnesium chloride, 0.1% (v/w) Polysorbate-80, 0.1 mM EDTA and 0.5% (v/w) ethanol, pH 6.6

Supplier: AstraZeneca

Batch (Lot) Number: BN20-1689

Date of Manufacture: 24 Aug 2020

Expiration Date: 24 Feb 2021

Storage Conditions: In a refrigerator set to maintain 2-8°C.

9.3. Test and Control Item Characterisation

The Sponsor will provide to the Test Facility documentation of the identity, strength, purity, composition and stability for the test item. A Test Item (Compound) Characterisation Summary (TICS) and Test formulation Summary (TFS) or equivalent documentation will be provided for retention in the raw data.

The Sponsor has appropriate documentation on file concerning the method of synthesis, fabrication or derivation of the test and control item(s), and this information is available to the appropriate regulatory agencies should it be requested.

9.4. Analysis of Test Item

The stability of the bulk test item will not be determined during the course of this study. Information to support the stability of each lot of the bulk test item will be provided by the Sponsor.

The stability and viral particle concentration of the test item has not currently been conducted in accordance with the principles of GLP, however, this has been conducted in accordance with a high standard of scientific principles. The test item will be used as supplied, and will be removed from frozen storage on the morning of each dosing occasion, and used when thawed and brought to room temperature within the time period stated in the supplied data. The stability and viral particle concentration data generated have been reviewed and are considered to be of a suitable

Appendix 1

quality (performed according to GMP) and therefore, this exception from GLP is considered to have no impact on the outcome or the integrity of the study.

9.5. Reserve Samples

A reserve sample will not be retained at the Test Facility as the Sponsor has indicated that they will retain a reserve sample.

9.6. Test and Control Item Inventory and Disposition

Records of the receipt, distribution, and storage of test and control items will be maintained. The quantity of test item/control item remaining will be communicated to the Study Monitor, who will decide if it should be discarded or returned to the Sponsor.

Shipping Contact

10. SAFETY

Safety instructions for this study are provided on the Sponsor supplied safety data sheet. COSHH assessment and classification will be carried out at the Test Facility on a Chemical Classification Spreadsheet.

11. DOSE FORMULATION AND ANALYSIS

11.1. Preparation of Control Item

The control item, AZD1222 Vehicle, will be dispensed as required. The control item will be removed from the refrigerator on the morning of dosing and delivered to the animal unit on 'wet' ice. On arrival at the animal unit, dosing vials will be allowed to reach room temperature before dosing.

Thawed vials cannot be re-frozen or re-used and will be disposed of after being used for dosing formulation preparation.

Any residual volumes will be discarded unless otherwise requested by the Study Director.

11.2. Preparation of Test Item

The test item, AZD1222, will be administered as received. The required number of vials will be removed from the freezer on the morning of dosing and delivered to the animal unit on 'wet' ice. On arrival at the animal unit, dosing vials will be allowed to reach room temperature before dosing.

Appendix 1

Thawed vials cannot be re-frozen or re-used and will be disposed of after use.

Any residual volumes will be discarded unless otherwise requested by the Study Director.

11.3. Sample Collection and Analysis

The test and control items will be used as received from the Sponsor; therefore, samples for dose formulation analysis will not be collected by the Test Facility.

12. TEST SYSTEM

Species:	Mouse
Strain:	CD-1 Crl:CD-1 (ICR)
Condition:	Purpose-bred, naive
Source:	Charles River UK Limited, Margate, Kent, UK
Number of Males Ordered:	88 (including 3 extras)
Number of Females Ordered:	88 (including 3 extras)
Target Age at the Initiation of Dosing:	7-8 weeks
Target Weight at the Initiation of Dosing:	20-40 g

The actual age and weight of animals will be listed in the Final Report.

12.1. Justification of Test System and Number of Animals

The mouse was chosen as the animal model for this study as it is a rodent species accepted by regulatory agencies for toxicity testing.

The total number of animals to be used in this study is considered to be the minimum required to properly characterise the effects of the test item. This study has been designed such that it does not require an unnecessary number of animals to accomplish its objectives.

12.2. Animal Identification

At study assignment, each animal will be identified using a subcutaneously implanted electronic cylindrical, ‘glass-sealed’ TROVAN microchip.

12.3. Environmental Acclimation

The animals will be allowed to acclimate to the Test Facility rodent toxicology accommodation for a period of up to 3 weeks (minimum of one week) before the commencement of dosing.

12.4. Selection, Assignment, Replacement and Disposition of Animals

Males and females will be randomised separately.

Appendix 1

Cages will be racked by dose group and arranged vertically throughout the rack. Control animals will be housed on a separate rack.

Before the initiation of dosing, any assigned animals considered unsuitable for use in the study will be replaced by alternative animals obtained from the same shipment and maintained under the same environmental conditions.

After initiation of dosing, study animals may be replaced during the replacement period with alternative animals in the event of accidental injury, non-test item-related health issues, or similar circumstances.

The alternative animals may be used as replacements on the study within 3 days.

The disposition of all animals will be documented in the study records.

13. HUSBANDRY

13.1. Housing

Males will be housed individually and females will be housed 2 or 3 per cage (unless reduced by mortality) in solid bottom polyethermide plastic cages with wire bar lid.

Bedding material will be sterilised white wood shavings which will be provided with a certificate of analysis for significant contaminants. An analytical certificate for each batch of bedding used will be retained at the Test Facility.

There are no known contaminants in the bedding that would interfere with the objectives of the study.

13.2. Environmental Conditions

The targeted conditions for animal room environment will be as follows:

Temperature:	19 - 23°C
Humidity:	40 - 70%
Ventilation:	A minimum of 10 air changes per hour
Light Cycle:	12 hours light and 12 hours dark (except when interrupted by study procedures/activities)

There will be automatic control of temperature and humidity which will be continuously monitored and recorded. Information on actual temperature and humidity ranges versus target ranges will be presented in the study report.

The light cycle will be controlled automatically.

Appendix 1

13.3. Food

SDS Rat and Mouse No. 1 Diet SQC Expanded will be provided *ad libitum* throughout the study, except during designated procedures. The same diet in meal form may be provided to individual animals as warranted by clinical signs (e.g. broken/damaged incisors or other health changes).

The feed is analysed by the supplier for nutritional components and environmental contaminants. Results of the analysis are provided by the supplier and will be retained at the Test Facility.

There are no known contaminants in the feed that are considered to interfere with the objectives of the study.

13.4. Water

The animals will have access to water *ad libitum* from the public supply from water bottles which will be changed as necessary throughout the course of the study.

The water used by the Test Facility is analysed at regular intervals for dissolved materials, heavy metals, pesticide residues, pH, nitrates and nitrites. Microbiological screening is also conducted. An analytical certificate for each analysis will be retained at the Test Facility.

The water used is considered not to contain any additional substances, in sufficient concentration, to have any influence on the outcome of the study.

13.5. Animal Enrichment

For psychological/environmental enrichment, males will be provided with items such as a device for hiding in and an object for chewing, except when interrupted by study procedures/activities.

Females will be socially housed for psychological/environmental enrichment and will be provided with items such as a device for hiding in and an object for chewing, except when interrupted by study procedures/activities.

Objects for chewing and devices for hiding in will be provided with a certificate of analysis for significant contaminants. An analytical certificate for each batch of chewing objects and devices for hiding used will be retained at the Test Facility.

Other items may be included to enrich the cage environment. Details will be given in the study report.

13.6. Veterinary Care

Veterinary care will be available throughout the course of the study and animals will be examined by the veterinary staff as warranted by clinical signs or other changes. All veterinary examinations and recommended therapeutic treatments, if any, will be documented in the study records.

In the event that animals show signs of illness or distress, the responsible veterinarian may make initial recommendations about treatment of the animal(s) and/or alteration of study procedures,

Appendix 1

which must be approved by the Study Director or by Test Facility management if the Study Director is not available, except where detailed below where immediate action is required to address a potentially life-threatening situation, or to alleviate acute severe pain. All such actions will be documented in the study records and, when appropriate, by protocol amendment. Treatment of the animal(s) for minor injuries or ailments may be approved without prior consultation with the Sponsor representative when such treatment does not impact fulfilment of the study objectives. If the condition of the animal(s) warrants significant therapeutic intervention or alterations in study procedures, the Sponsor representative will be contacted, when possible, to discuss appropriate action. If the condition of the animal(s) is such that emergency measures must be taken, the Study Director and/or attending veterinarian will attempt to consult with the Sponsor representative prior to responding to the medical crisis, but the Study Director and/or veterinarian has authority to act immediately at his/her discretion to alleviate suffering. The Sponsor representative will be fully informed of any such events.

14. EXPERIMENTAL DESIGN

Experimental Design

Group No.	Animal Numbers					
	Main Study		Recovery		Immunogenicity	
	Males	Females	Males	Females	Males	Females
1	1001-1020	1501-1520	1101-1120	1601-1620	-	-
2	2001-2020	2501-2520	2101-2120	2601-2620	2201-2205	2701-2705

Extra animals will be numbered 3001-3003M and 3501-3503F
- = Not applicable

Group No.	Dose Volume[a] (µL)	Total Viral Particle (VP)/dose	Viral Particle (VP) Concentration per 1 mL
1	70	0	0
2	70	3.7×10^{10}	5.3 x10^11

[a] 35 µL will be administered in the thigh muscle of each hind limb on each dosing occasion (total dose volume = 0.07 mL)

14.1. Administration of Test and Control Items

The test or control items will be administered to the appropriate animals by intramuscular injection (dose split across two dose sites) on Days 1, 22 and 43. The first day of dosing will be designated as Day 1. The dosing formulations will be allowed to reach room temperature before administration. Animals will generally be dosed during the morning.

The doses will be given using a graduated syringe and sterile hypodermic needle (details of the gauge and type of needle used will be retained in the raw data).

Appendix 1

Each hindlimb (thigh) will receive 0.035 mL, total dose of 0.07 mL.

Left hindlimb = Site 1

Right hindlimb = Site 2

The administration sites will be clipped free of hair before the first injection. The injection site will be marked. Further clipping and marking will occur as necessary to maintain visibility of each site.

14.2. Recovery Period

On completion of the dosing period, the designated recovery animals will be retained for a minimum 28 day recovery period.

14.3. Justification of Route and Dosage Levels

The intramuscular injection route of administration has been selected for this study as this route has been defined by the Sponsor as the route of clinical application.

Regulatory guidelines indicate that the highest proposed clinical dose should be evaluated in the animal model, and an additional dose included (n+1). For this vaccine the clinical dose is not expected to exceed 5x10^10 virus particles/dose with the number of dosing occasions being 2. However, as the dose is limited by the volume that can be administered by intramuscular injection to mice, the maximum feasible dose of 3.7 x10^10 virus particles will be given. On a body weight basis, this exceeds the human exposure by >1000x, assuming 50 kg human and 50 g mouse. Previous data generated for the Sponsor indicated that 1.7x10^10 virus particles/dose in mice induced an appropriate immune response. Charles River Study No. 490838 [1] has shown that 2.6x10^10/dose produced no in-life adverse signs of toxicity.

15. IN-LIFE PROCEDURES, OBSERVATIONS, AND MEASUREMENTS

15.1. Mortality/Moribundity Checks

Frequency:	Twice daily, once at the start and once towards the end of the working day throughout the study.
Procedure:	Animals will be observed for general health/mortality and moribundity. Animals will not be removed from the cage during observation, unless necessary for identification or confirmation of possible findings.

15.2. Clinical Observations

15.2.1. Detailed Clinical Observations

Frequency:	Weekly, beginning Week -1.

Appendix 1

Procedure: Animals removed from the cage for examination.

15.2.2. Pre and Post dose Observations

Frequency: Regularly throughout the day on dosing days. On non-dosing days, signs will be recorded at least once.

Procedure: All the animals will be examined for reaction to AZD1222. The onset, intensity and duration of these signs will be recorded (if appropriate). Control animals will be similarly examined for comparison.

15.3. Body Temperature

Frequency: Pretreatment – once; Dosing Period – Day 1, 4 hours post dose (±1 hour) and 24 hours post dose (±1 hour).

Day 22, pre-dose (this may be collected the day before), 4 hours post dose (±1 hour) and 24 hours post dose (±1 hour).

Procedure: The rectal temperature of 10 male and 10 female main study animals will be recorded.

15.4. Body Weights

Frequency: Once pretreatment, on each dosing Day (Days 1, 22 and 43) and 3 days after the first and second dosing occasion (i.e. Days 2-4, 23-25) and for two days after the third dosing occasion (i.e. Day 44-45) Twice weekly during non-dosing weeks.

Procedure: Animals will be individually weighed. A weight will be recorded on each day of scheduled necropsy.

15.5. Food Consumption

Frequency: Once during pretreatment
Day 1, Day 22, Day 43 (i.e. Days 1-2, 22-23 and 43-44). Twice weekly during non-dosing weeks.

Procedure: Food consumption will be quantitatively measured.

15.6. Dermal Scoring

Frequency: Each dosing occasion: Predose, 4 h post dose, then daily until any reaction is resolved and at termination.

Procedure: Skin will be assessed for erythema and eschar formation, oedema formation and any other reaction to treatment.

Appendix 1

15.7. ~~Modified~~ Irwin Screen Observations

On Days 8 and 29, the first six males per group (main study animals) will be observed and the following parameters will be included in the observations:

Occurrence of vocalisation, stereotypies, aggressiveness, abnormal gait, straub tail, abducted hind limbs, tremor, twitches, convulsions, body posture, sedation, catalepsy, ptosis, exophthalmos, salivation, lacrimation, piloerection, abnormal respiration, defecation, urination and death.

Increase or decrease of spontaneous activity, touch response and body tonus. Increase of sniffing, grooming, scratching and rearing.

Decreased pinna reflex, traction response and grip strength. Any additional symptoms observed will also be noted.

Frequencies of animals exhibiting symptoms will be recorded. Symptoms will be scored from 0 to 3, where 0 represent no findings and 3 the highest score.

Pupil size will be measured using a guidance chart to estimate the size in millimetres.

Body temperature will be measured by using a probe inserted approx. 2 cm past the anal sphincter. At least 30 minutes prior to the commencement of observations, to reduce measurement variability, a temperature habituation trial will be conducted by inserting the temperature probe, however, no temperature data will be collected during this trial.

15.7.1. Apparatus

The traction response will be measured by assessing the ability of mice to pull themselves up onto a cage top.

Grip strength will be assessed by allowing mice to grip onto the cage lid. Hold the mouse and let it grip onto the grid with all paws and then gently pull the mouse backwards from the lid.

A proforma with a size scale will be used for assessing relative pupil sizes only and no exact sizes will be calculated or implied.

A thermometer, with a flexible probe, will be used to measure body temperature.

16. LABORATORY EVALUATIONS

16.1. Clinical Pathology

16.1.1. Blood Sample Collection

Blood will be collected from the orbital sinus under non-recoverable isoflurane anaesthesia, in ascending animal order unless samples are collected prior to necropsy where the order of euthanasia will be followed. Animals will not be fasted.

After collection, samples will be transferred to the appropriate laboratory for processing.

Appendix 1

Samples will be collected according to the following table.

Samples for Clinical Pathology Evaluation

Group Nos.	Time Point	Haematology	Plasma Chemistry
First 10 numbered Main Study animals per sex per group	Day 45	X	-
Second 10 numbered Main Study animals per sex per group		-	X
First 10 numbered Recovery animals per sex per group	Day 74	X	-
Second 10 numbered Recovery animals per sex per group		-	X
Unscheduled euthanasia of whole group (when possible)	Before euthanasia	X	X

X = sample to be collected; - = not applicable. Individual premature decedents will not be sampled.

Any residual/retained clinical pathology samples will be discarded following approval of the results by Charles River Clinical Pathology Department, and before issue of the Final Report.

16.1.2. Haematology

Target Volume: 0.3 mL

Anticoagulant: K_2EDTA

Haematology Parameters

Red blood cell count Haemoglobin Haematocrit Mean corpuscular volume Mean corpuscular haemoglobin concentration Mean corpuscular haemoglobin Reticulocytes (%) Reticulocyte count (absolute)	Red blood cell distribution width Platelet count White blood cell count Neutrophil count (absolute) Lymphocyte count (absolute) Monocyte count (absolute) Eosinophil count (absolute) Basophil count (absolute) Large unstained cells Blood Smear (see ^ below)

^ A blood smear will be prepared from each haematology sample. Blood smears will be labelled, stained, and stored. Individual blood smears may be examined to confirm certain analyser results, as required by SOP.

Appendix 1

If additional examination of blood smears is deemed necessary, the smears may be subsequently evaluated and this evaluation will be described in a protocol amendment.

Morphology findings that require confirmation, as required by SOP, will be reviewed by a clinical pathologist in Charles River.

16.1.3. Plasma Chemistry

Target Volume: As much as possible (no more than 1.0 mL required)

Anticoagulant: Lithium Heparin

Processing: To plasma

Plasma Chemistry Parameters

Aspartate aminotransferase	Triglycerides
Alanine aminotransferase	Phosphate
Alkaline phosphatase	Calcium
Glutamate dehydrogenase	Total Bile Acids
Total protein	Sodium
Albumin	Potassium
Globulin	Chloride
Total bilirubin[a]	Albumin/globulin ratio
Urea	Lipaemia (visual qualitative assessment)
Creatinine	Icterus (visual qualitative assessment)
Cholesterol	Haemolysis (Visual Qualitative Assesment)
Glucose	

[a] When total bilirubin is >8.55µmol/L, indirect and direct bilirubin will also be measured

16.1.4. Bone Marrow Smear Evaluation

Bone marrow smears will be collected as described in the Tissue Collection and Preservation table (Section 17.5). Evaluation of stained smears may be added by amendment at the discretion of the Study Director in consultation with the pathologist and the Sponsor.

16.2. Immunogenicity Evaluation

16.2.1. Immunogenicity Sample Collection

Blood will be collected from the saphenous vein of all immunogenicity animals using a suitably sized needle.

Samples will be collected on the following occasions.

Pretreatment, Day 22 (before dosing), Day 43 (before dosing) and Day 74 (at termination).

Target Volume: 0.2 mL

Anticoagulant: None (serum separator tubes)

Appendix 1

16.2.2. Immunogenicity Sample Processing

Samples will be allowed to clot at ambient temperature for at least 60 minutes before centrifugation. The samples will be centrifuged at 1500 *x* g for 10 min in a centrifuge set to 4°C and the resultant serum will be separated, transferred to uniquely labelled clear polypropylene tubes, and frozen immediately over dry ice before being transferred and stored in a freezer set to maintain -80°C.

Serum tube labelling: All serum samples will be marked with the study number, animal number, group number and experimental day number.

Samples will be shipped after Day 22, 43 and 74 on dry ice to the following address.

Shipping Contact

The analytical laboratory will be notified before shipment of the samples. Upon receipt at the bioanalytical laboratory, the samples will be stored in a freezer set to maintain -80°C.

16.2.3. Immunogenicity Sample Analysis

Sample analysis; Immunogenicity will be performed by AZ and supplied to CRL as tabulated data. Interpretation of this data within the main report will be performed by a scientist at the Test Facility, s 22

The full details of the immunogenicity bioanalysis method are included in the Phase Plan and a copy of the Phase Plan is included in Attachment 1. The individual data will be reported in the phase report which will be included as an appendix to the main report and the interpretation of the data and summary data tables will be included in the main report.

Appendix 1

17. TERMINAL PROCEDURES

Terminal procedures are summarised in the following table:

Terminal Procedures for Main Study and Recovery Animals

Group Number	Number of Animals		Scheduled Euthanasia Day	Necropsy Procedures			Histology[b]	Histopathology[b]
	M	F		Necropsy	Tissue Collection	Organ[a] Weights		
1	20	20	45 (main study)	X	X	X	Full Tissue or Blocks only[c]	Full Tissue[d]
2	20	20					Full Tissue or Blocks only[c]	Full Tissue[d]
1	20	20	74 (recovery)	X	X	X	Full Tissue or Blocks only[c]	Full Tissue[d]
2	20	20					Full Tissue or Blocks only[c]	Full Tissue[d]
Unscheduled Deaths				X	X	-	Full Tissue	Full Tissue

X = procedure to be conducted; - = not applicable; Block = processed tissue to wax cassette.
[a] See Tissue Collection and Preservation table for listing of weights.
[b] See Tissue Collection and Preservation table for listing of tissues.
[c] Tissues from the remaining 10 animals will be processed to wax block and stored pending possible future evaluation, which will be documented in a protocol amendment, if required.
[d] Only tissues from the first 10 animals/sex/group will be evaluated histopathologically.

17.1. Unscheduled Deaths

If a main study or recovery animal dies on study or is killed for humane reasons, a necropsy will be conducted and specified tissues will be saved. If necessary, the animal will be refrigerated to minimise autolysis.

Main study or recovery animals may be euthanised for humane reasons as per Test Facility SOPs. The body weight will be recorded and samples for evaluation of clinical pathology parameters (if an entire group of animals are euthanised) will be obtained if possible as specified in Section 16. These animals will undergo necropsy, and specified tissues will be retained. If necessary, the animal will be refrigerated to minimise autolysis.

Immunogenicity animals that die on study or are euthanised for humane reasons will have blood sample collected for immunogenicity analysis as specified in Section 16. The animal will be subjected to necropsy examination as detailed in Section 17.3 and tissues will be retained without evaluation. If required, evaluation will be documented in a protocol amendment.

17.2. Scheduled Euthanasia

Main study and recovery animals surviving until scheduled euthanasia will have a terminal body weight recorded, and will be euthanised by exposure to a rising concentration of carbon dioxide followed by exsanguination. When possible, the animals will be euthanised in a rotating order

Appendix 1

across dose groups such that similar numbers of AZD1222 and control animals will be necropsied throughout the day. Animals will not be fasted before their scheduled necropsy.

Immunogenicity animals surviving until scheduled euthanasia will be euthanised by an approved method. No necropsy will be performed and no tissues will be collected.

17.3. Necropsy

Main and recovery animals will be subjected to a complete necropsy examination, which will include evaluation of the carcass and musculoskeletal system; all external surfaces and orifices; cranial cavity and external surfaces of the brain; and thoracic, abdominal, and pelvic cavities with their associated organs and tissues. Macroscopic abnormalities will be recorded. Necropsy examinations will be conducted by a trained technician and will consist of an external and internal examination and recording of observations for all animals. A veterinary pathologist will be available for consultation during normal working hours.

At the discretion of the necropsy supervising pathologist, images may be generated for illustration of or consultation on gross observations. Generation of such images will be documented and communicated to the Study Director. Images and associated documentation will be retained and archived.

Any remaining tissues not required for histopathology or retention may be harvested from the carcass of control animals before disposal. These tissues, if collected, may be used for validation or investigational purposes and as such are not part of this study.

17.4. Organ Weights

The organs identified for weighing in the Tissues Collection and Preservation table will be weighed at necropsy (unless otherwise specified) for all scheduled euthanasia animals. Organ weights will not be recorded for animals found dead or euthanised in poor condition or in extremis. Paired organs will be weighed together. In the event of gross abnormalities, in addition to the combined weight, the weight of each organ of a pair may be taken and entered as a tissue comment. Terminal body weights will be used for organ weight analysis.

17.5. Tissue Collection and Preservation

Representative samples of the tissues identified in the Tissue Collection and Preservation table will be collected from all animals and preserved in 10% neutral buffered formalin, unless otherwise indicated. Additional tissue samples may be collected to elucidate abnormal findings.

Appendix 1

Tissue Collection and Preservation

Tissue	Weigh	Collect	Microscopic Evaluation	Comment
Administration site 1	-	X	X	Left thigh
Administration site 2	-	X	X	Right thigh
Animal identification	-	X	-	-
Artery, aorta	-	X	X	From thoracic segment.
Bone marrow smear	-	X	-	Two bone marrow smears will be collected from the femur at scheduled and unscheduled necropsies (for possible examination). Smears will not be collected from animals that are found dead or from animals that were euthanised moribund and then stored in the refrigerator prior to necropsy. Bone marrow smears are allowed to air dry and are fixed in Methanol.
Bone marrow, sternum	-	X	X	Collect with bone, sternum.
Bone, femur	-	X	X	Collect distal end to include femorotibial joint.
Bone, sternum	-	X	X	-
Brain	X	X	X	Eight brain levels to be examined to include caudal part of olfactory bulb (Bolon sections). Olfactory bulbs (OB) to be severed from the brain at necropsy and left to fix in the skull with calvarium removed; OB removed from skull at trimming for processing and embedding.
Cervix	-	X	X	Collect with uterus.
Epididymis x 2	X	X	X	Preserve in Modified Davidson's fixative.
Eye x 2	-	X	X	Preserve in Davidson's fixative.
Gallbladder	-	X	X	Collected and weighed with liver.
Ganglion Dorsal Root	-	X	-	Collected with vertebral column. The vertebral column will be trimmed at histology for the ganglion dorsal root.
Gland, adrenal x 2	X	X	X	-
Gland, harderian x 2	-	X	X	-
Gland, mammary	-	X	X	Collect with inguinal skin. Examine in males only if present on routine section of inguinal skin.
Gland, parathyroid x 2	-	X	X	Collect with gland, thyroid. Examine only if present in the routine section of gland, thyroid.
Gland, pituitary	X	X	X	-
Gland, prostate	X	X	X	-
Gland, salivary x2	-	X	X	Mandibular.
Gland, salivary x2	-	X	X	Parotid.
Gland, seminal vesicle	-	X	X	Left and right horns.
Gland, thyroid x2	-	X	X	-
Gross lesions/masses	-	X	X	Include local draining lymph nodes to masses.
Heart	X	X	X	-
Hindlimb x 2	-	X	-	The right and left hindlimb, including the foot, will be collected after removal of other tissues from this and the surrounding area.
Kidney x 2	X	X	X	-

Appendix 1

Tissue	Weigh	Collect	Microscopic Evaluation	Comment
Large intestine, caecum	-	X	X	-
Large intestine, colon	-	X	X	-
Large intestine, rectum	-	X	X	-
Liver	X	X	X	-
Lung	X	X	X	Infuse with 10% neutral buffered formalin after weighing. If a lung infection is suspected at necropsy, diagnostic tissue samples should be taken for bacteriology.
Lymph node, inguinal	-	X (2)	X	Left and right nodes.
Lymph node, mandibular	-	X	X	-
Lymph node, mesenteric	-	X	X	-
Muscle, skeletal	-	X	X	From gastrocnemius.
Nerve, optic x 2	-	X	X	Preserve in Davidson's fixative. Examine only if present in the routine section of the eye.

18. HISTOLOGY AND HISTOPATHOLOGY

18.1. Histology

Tissues in the Tissue Collection and Preservation table from animals identified in the Terminal Procedures table will be embedded in paraffin, sectioned, mounted on glass slides, and stained with haematoxylin and eosin.

Appendix 1

18.2. Histopathology

Histopathological evaluation will be performed by a veterinary pathologist with training and experience in laboratory animal pathology. Tissues identified as target tissues will be examined from animals identified in the Terminal Procedures table, by protocol amendment. Any additional stains or evaluations, if deemed necessary by the pathologist, will be added by protocol amendment following discussion with the Study Director and in consultation with the Sponsor.

At the discretion of the study pathologist and after acknowledgement by the study director, images may be captured for illustration of or consultation on histological observations. These illustration images will not be used for data generation or interpretation and will not be archived or included in the Final Report.

18.3. Pathology Peer Review

An external pathology peer review, according to the Sponsors' standard operating procedures, will be conducted by an AstraZeneca Peer Reviewing Pathologist at Astra Zeneca. The review will not claim GLP compliance.

All slides will be scanned at 40 X using a Leica Aperio ScanScope® AT2 Slide Scanning System to generate Whole Slide Images (WSI) according to the relevant Charles River Edinburgh SOPs. Peer review will be undertaken by the sponsor peer review pathologist using the WSI scans accessed through the Charles River Laboratories server (Leica eSlide Manager®) and reviewed using the associated web viewer. All WSI files may also be copied to an external drive and shipped to the peer review pathologist at the address above.

The peer review statement or equivalent documentation will be included as an appendix to the Final Report.

19. COMPUTERISED SYSTEMS

The following critical computerised systems may be used in the study. Any additional critical computerised systems used during the course of the study will be added by protocol amendment. The actual critical computerised systems used will be specified in the Final Report.

Data for parameters not required by protocol, which are automatically generated by analytical devices used will be retained on file but not reported. Statistical analysis results that are generated by the program but are not required by protocol and/or are not scientifically relevant will be retained on file but will not be included in the tabulations.

Appendix 1

Critical Computerised Systems

System Name	Description of Data Collected and/or Analysed
Dispense	Test item receipt, accountability and/or formulation activities
Provantis	Applicable in-life, clinical pathology and postmortem
MSD Analysis	Immunogenicity
MSD SECTOR S 600	Immunogenicity
In-house reporting software Nevis (using SAS)	Applicable in-life, clinical pathology and postmortem
Deviation Information Library	Deviations
Vaisala/Trend 963 Secure	Continuous temperature and humidity recording. Alarms for animal rooms, refrigerators, freezers and incubators.
Share Document Management System	Reporting
Docusign	Collection of CFR Part 11 compliant signature
eSlide manager version 12.4.3.7006	Histopathology Peer Review

20. DATA AND STATISTICAL ANALYSIS

20.1. Irwin Data Analysis

Frequencies of mice exhibiting a given symptom will be reported in tabulated form. Severity scores of the observed symptoms will be measured in four categories (0, 1, 2, or 3) and will be presented as the dose group mean of the maximal possible score [MPS=score/max score*100] for each mouse at each time point. MPS will be displayed graphically for symptoms with statistically significant findings.

Observations such as death and seizures will always be considered significant regardless of frequency. For all other symptoms the statistical analysis will be performed using SAS v9.4 (or a later version) as follows:

1. Severity score will be modelled as a categorical outcome (0, 1, 2, or 3) and will be compared between Group 2 and Group 1 using a two-sided Fisher's exact test at a significance level of 20% (no multiple testing correction).

20.2. Statistical Analysis

Unless otherwise stated, all statistical tests will be two-sided and performed at the 5% significance level. Males and females will be analysed separately. Where data are collected at repeated time points, each time point will be analysed separately.

Pairwise comparisons will only be performed against the control group (Group 1). The following pairwise comparisons will be performed:

Control Group v Group 2

Body weight, food consumption, pupil size, absolute organ weights and organ weights as a percentage of terminal body weight will be analysed using a parametric ANOVA. Pairwise comparisons will be made using Dunnett's t test if the overall F-test is significant (provided there

Appendix 1

are 3 groups to compare). Datasets with two groups will be compared using a Dunnett's test (equivalent to t-test in Nevis 2012 tables).

Haematology and plasma chemistry will be analysed using a Kruskal-Wallis nonparametric ANOVA. Pairwise comparisons will be made using Dunn's test if the overall Kruskall-Wallis test is significant.

In the ANOVA summary tables, the results of the analysis will be reported indicating the level of statistical significance ($p \leq 0.05$, $p \leq 0.01$ and $p \leq 0.001$) of each pairwise comparison.

Actual p-values will not be reported in the summary tables for these analyses.

More extensive analysis will be carried out only after consultation with the sponsor and will involve additional costs.

21. AMENDMENTS AND DEVIATIONS

Changes to the approved protocol shall be made in the form of an amendment, which will be signed and dated by the Study Director. Every reasonable effort will be made to discuss any necessary protocol changes in advance with the Sponsor.

All protocol and SOP deviations will be documented in the study records. Deviations from the protocol and/or SOP related to the phase(s) of the study conducted at a Test Site shall be documented, acknowledged by the PI, and reported to the Study Director for authorisation/acknowledgement. The Study Director will notify the Sponsor of deviations that may result in a significant impact on the study as soon as possible.

22. RETENTION OF RECORDS, SAMPLES AND SPECIMENS

All study-specific raw data, electronic data, documentation, protocol, protocol amendments, retained samples and specimens, and interim (if applicable) and final reports generated by Charles River from this study will be transferred to a Charles River archive. Three years after issue of the final report, the Sponsor will be contacted to determine the disposition of materials associated with the study. The original signed copy of the final report will be archived indefinitely at the Test Facility.

Records to be maintained will include, but will not be limited to, documentation and data for the following:

- Protocol, protocol amendments, and deviations
- Study schedule
- Study-related correspondence
- Test system receipt, health, and husbandry
- Test and control item receipt, identification, preparation, and analysis
- In-life measurements and observations

Appendix 1

- Clinical pathology sample collection and evaluation
- Immunogenicity sample collection
- Gross and microscopic observations and related data
- Whole Slide Image (WSI) Electronic Files generated by Leica Aperio ScanScope® AT2 Slide Scanning System
- Organ weight measurements
- Statistical analysis results

23. REPORTING

A comprehensive Draft Report and Toxicology AZ/CTD tabulated summary will be prepared following completion of the study and will be finalised following consultation with the Sponsor. The report will include all information necessary to provide a complete and accurate description of the experimental methods and results and any circumstances that may have affected the quality or integrity of the study.

The Sponsor will receive an electronic version of the Draft and Final Report provided in Adobe Acrobat PDF format (Acrobat Versions 5 or 6 hyperlinked and searchable at final) along with a Microsoft Word version of the text. The PDF document will be created from native electronic files to the extent possible, including text and tables generated by the Test Facility. Report components not available in native electronic files and/or original signature pages will be scanned and converted to PDF image files for incorporation. A signed copy of the final report will be retained at the Test Facility.

Special attention will be paid to the following:

All fonts must be embedded

Book marks and cross-references are created using Inherit Zoom and not Named Destinations

The PDF file is not “tagged”

Reports should be finalised within 6 months of issue of the audited Draft Report. If the Sponsor has not provided comments to the report within 6 months of draft issue, the report will be finalised by the Test Facility unless other arrangements are made by the Sponsor.

23.1. SEND Datasets

At the request of the Sponsor, SEND datasets will be generated and provided outside the context of the Final GLP Report. These datasets will not be subject to QA Audit nor will they be used as the basis for the Study Director interpretation of the study results. SEND datasets will be provided following the Draft and/or Final Report.

Appendix 1

24. ANIMAL WELFARE

The UK Home Office controls scientific procedures on animals in the UK and does so by the issue of licences under the Animals (Scientific Procedures) Act 1986. The regulations conform to EU Directive 2010/63/EU and achieve the standard of care required by the US Department of Health and Human Services' Guide for the Care and Use of Laboratory Animals.

The Home Office licence governing this study strictly specifies the limits of severity of effects on the animals. From the available information, the procedures described in the protocol are not anticipated to cause any effects which exceed the severity limit of the procedure. Any animal which shows unacceptable reactions may be killed or other actions taken as required by the Home Office to alleviate distress.

24.1. Home Office Project Licence No.

PBAD559F8, Toxicology of Pharmaceuticals, Protocol No. 1.

From 04 Nov 2020, the licence will change to PP7137579, Protocol 2.

2 INTRODUCTION

2.1 Phase Objectives

The purpose of this bioanalytical phase is the detection of IgG antibodies against SARS-CoV-2 spike protein in murine serum samples, following administration of ChAdOx1-nCovd-19 (AZD1222) within study 513351; a 6 week intermittent dosing intramuscular vaccine toxicity study in the mouse with a 4 week recovery. The Test Facility for Study 513351 is Charles River Laboratories Edinburgh Ltd, UK. AZD1222 is under development by AstraZeneca as a potential COVID-19 vaccine.

The immunogenicity method to be used in this bioanalytical phase was validated under Test Site study number 2020-AZD1222-0213, with a further partial validation under 2020-AZD1222-0227. Method development was documented in lab book 8245-20.

2.2 Immunogenicity Assay Context of Use

AZD1222 is a vaccine against COVID-19 and encodes the spike protein of the SARS-CoV-2 coronavirus. The purpose of the assay is in support of murine toxicology studies to demonstrate seroconversion of animals against the SARS-CoV-2 spike protein following immunisation with AZD1222. The assay is a relative-quantitative immunoassay in murine serum performed on the MSD platform, using a monoclonal antibody against the SARS-CoV-2 spike protein as calibrator. Data from the assay will be used to demonstrate exposure in the animals to the vaccine and seroconversion against the spike protein.

Antibody levels are expected to change in fold-level increases following prime and prime boost immunisations and as such the acceptance criteria specified for assay parameters in this plan are deemed appropriate for the defined context of use.

2.3 GLP Compliance

This phase of the study will be conducted in compliance with the OECD Principles of GLP (ENV/MC/CHEM) (98)17 (1997), as implemented at the national level in the UK GLP Regulations, Statutory Instrument 3106 (1999), as amended by Statutory Instrument 994 (Codification Amendments Etc.) (2004). This phase will also be conducted to current Standard Operating Procedures.

Appendix 1

Test Site Identifier: 2020-AZD1222-0217
Study Number: 513351

2.4 Quality Assurance

Test Site QA will review the phase plan and audit the final phase report. At AstraZeneca the GLP & Research Quality Assurance (GLP & RQA) department fulfils the role of QA as defined in the UK GLP regulations. GLP & RQA will conduct phase specific audits, however, process-based audits may also be utilised or used in place of phase specific audits. The findings of any audits carried out in this phase will be reported promptly to the PI, Test Site Management, the Study Director, Test Facility Management and Lead QA. The types of audits conducted, and the dates of inspection and reporting will be specified in a Quality Assurance statement, for inclusion in the final bioanalytical phase report.

3 PHASE SCHEDULE

Proposed Experimental Starting Date:	Week Commencing 23-Nov-2020
Proposed Experimental Completion:	Week Commencing 23-Nov-2020
Proposed Date of audited Final Report:	23-Dec-2020

4 MATERIALS

4.1 Critical Reagents

4.1.1 Anti-SARS-CoV-2 Antibody - Calibrator

Company Code/Name:	CV191074 Murine IgG2a
Concentration:	1.17 mg/mL
Lot Number:	CV191074-003 (BET280820)
Re-test Date:	Assigned 27-Oct-2022
Storage Conditions:	Nominally -80°C
Source:	AstraZeneca Biologics Expression Team Cambridge, UK

4.1.2 SARS-CoV-2 Trimeric Spike Protein

SARS-CoV-2 Trimeric spike protein (to be termed 'Trimer') will be supplied by Biopharmaceutical Development, AstraZeneca. Trimer will be assigned a retest date and

Appendix 1

stored at nominally -80°C. Full details including lot number will be recorded in the raw data and final report.

4.1.3 Detection Antibody

SULFO-TAG labelled goat anti-mouse antibody will be supplied by MSD (product number: R32AC-1) and stored at 2 to 8°C. Full details including lot number and expiry date will be recorded in the raw data and final report.

4.1.4 Control Biological Matrix

Pooled mouse serum samples will be supplied as required by an appropriate vendor, with required safety information, and stored in a freezer set at -80°C. Full details of batch numbers and expiry dates will be recorded in the raw data and final phase report.

4.2 Other Reagents

4.2.1 MSD 96 Well High Bind Plates

MSD 96 well high bind plates (product number: L15XB) will be obtained from MSD and stored as per manufacturer's instructions at room temperature. Batch numbers and expiry dates will be documented in the raw data and final phase report.

4.2.2 Blocker Casein in PBS (Assay Diluent)

Blocker Casein in PBS (Assay Diluent) (product number: 37528) will be obtained from Thermo Fisher Scientific and stored as per manufacturer's instructions at 2 to 8°C. Batch numbers and expiry dates will be documented in the raw data and final phase report.

4.2.3 MSD® Gold Read Buffer B

Read Buffer B (product number: R60AM) will be supplied by MSD® and stored as per manufacturer's instructions at room temperature. Batch numbers and expiry dates will be documented in the raw data and final phase report.

4.2.4 Tween 20

Tween 20 (product number: P2287-500ML) will be supplied by Sigma-Aldrich Company Ltd, UK and stored as per manufacturer's instructions at room temperature. Batch numbers and expiry dates will be documented in the raw data.

Appendix 1

4.2.5 Phosphate Buffered Saline (PBS) Tablets

PBS tablets (product number: BR0014G) will be supplied by OXOID and stored as per manufacturer's instructions at room temperature. Batch numbers and expiry dates will be documented in the raw data.

4.2.6 Dulbecco's Phosphate Buffered Saline

Dulbecco's Phosphate Buffered Saline (product number: 14190-086) will be obtained from Thermo Fisher Scientific and stored as per manufacturer's instructions at room temperature. Batch numbers and expiry dates will be documented in the raw data.

4.3 Critical Analytical Equipment and Validated Software

Equipment	Description
MSD SECTOR S 600	MSD, asset number: 200034966, serial number: 1201150625310
MSD Analysis Software	Discovery Workbench 4.0.12

A full list of equipment used will be kept in the phase file and key equipment will be detailed in the final report.

Appendix 1

Test Site Identifier: 2020-AZD1222-0217
Study Number: 513351

5 METHOD

5.1 Analytical Procedure

For the method a sequential direct format ECL immunoassay is used. MSD high-bind microtitre plates are coated with recombinant spike protein trimer from SARS-CoV-2 which captures any anti-SARS-CoV-2 immunoglobulins present in the calibrators, QC, and test samples. IgG is then detected using a SULFO-TAG-labelled goat anti-mouse antibody to form an immune complex. The complex is then detected by the addition of MSD Read Buffer to the plate and subsequent excitation of the SULFO-TAG label. The quantity of light detected correlates to the level of anti-SARS-CoV-2 IgG present in the sample.

A full description of the assay procedure is presented in Appendix 1 (Section 10) with assay proforma in Appendix 2 (Section 11).

5.2 Preparation of Reagents

The preparation of reagents necessary for the assay are included in the assay procedure in Appendix 1 (Section 10). All volumes may be scaled as appropriate. Exact preparation details will be recorded in the raw data.

5.3 Preparation of Calibration Standards

Anti-SARS-CoV-2 calibration standard curve will be prepared in mouse serum as detailed in Table 5.3-1.

Table 5.3-1 Preparation of Calibration Standards

Spiking Solution	Volume Spike (µL)	Vol. Mouse Serum (µL)	ID	Concentration (ng/mL)**
CV191074 (1.17 mg/mL)	10	81.4	Std1	128000
Std1	30	30	Std2	64000
Std2	30	30	Std3	32000*
Std3	30	30	Std4	16000
Std4	30	30	Std5	8000
Std5	30	30	Std6	4000
Std6	30	30	Std7	2000
Std7	30	30	Std8	1000
Std8	30	30	Std9	500
Std9	30	30	Std10	250*
Std10	30	30	Std11	125

Appendix 1

Test Site Identifier: 2020-AZD1222-0217
Study Number: 513351

Spiking Solution	Volume Spike (µL)	Vol. Mouse Serum (µL)	ID	Concentration (ng/mL)**
N/A	N/A	30	Blank	0.00

*Limits of quantification **Calculation rounded to 3 significant figures

Volumes may be scaled up or down as required.

5.4 Preparation of Quality Control (QC) Samples

Anti-SARS-CoV-2 quality control (QC) samples will be prepared by spiking the CV191074 calibrator antibody (Section 4.1.1) into mouse serum as detailed in Table 5.4-1. The QC samples will be assigned a batch number and expiry date and aliquoted and stored in a freezer set at -80°C.

Validation controls prepared within method partial validation (2020-AZD1222-0227) may also be reassigned as QCs for this analytical phase.

Table 5.4-1 Preparation of Quality Controls

Spiking Solution	Volume Spike (µL)	Vol. Mouse Serum (µL)	Concentration (ng/mL)	ID
CV191074 (1.17 mg/mL)	36	1720	24000	HQC
HQC	200	1400	3000	MQC
HQC	40	1495	625	LQC

Volumes may be scaled up or down as required. Calculations rounded to 3 significant figures

5.5 Final Preparation of Standards, Controls and Samples

All standards, QC, and study samples will be subject to a 100-fold minimum required dilution (MRD) in assay diluent (Blocker Casein in PBS) prior to analysis. Exact preparation details will be documented in the raw data.

5.6 Study Sample Preparation

All study samples will undergo the 100-fold MRD. Where required, samples may be diluted up to and including a further 800-fold in 1% murine serum. Samples will first undergo the 100-Fold MRD with subsequent dilutions post-MRD prepared by diluting in 1% murine serum. All samples will be tested in duplicate (n=2 replicates).

The exact dilution factor that will be required to obtain an acceptable result for each sample is unknown thus it may be necessary to simultaneously analyse samples at multiple dilutions. This is to manage limited sample volume and to ensure a valid result is obtained.

Appendix 1

Should multiple dilutions result in more than one acceptable determination, the result reported will be the result obtained from the lowest dilution factor.

5.7 Data Processing and Analysis

All data collection, processing and storage will be performed using the software detailed in Section 4.3 and Microsoft Excel. Full details of software used will be recorded in the phase file and final report.

The calibration curve fit will be a 4 parameter fit with $1/y^2$ weighting.

QC and Calibration Standard data will be reported to the nearest whole number in ng/mL. All test sample concentration data will be reported to 3 decimal places in AU/mL following a conversion factor of 0.001 (where AU = arbitrary units).

All precision (% CV) and accuracy (% RE) data will be reported to one decimal place.

6 ACCEPTANCE CRITERIA FOR ANALYTICAL BATCHES

6.1 Acceptance Criteria for Calibration Standards

Standard curve precision (% CV) and accuracy (% RE) must fulfil the following criteria; a minimum of 75% of the calibration standards (minimum of six non-zero standards within the working range) should have a precision of ≤ 30% CV and an accuracy of ±≤ 30% RE. Anchor points are not subject to these criteria. All standards will be analysed in duplicate (n=2). Accuracy will be assessed using the following equation:

% RE = [(Observed Value – Nominal Concentration)/Nominal Concentration)] x 100

Precision will be assessed using the following equation:

% CV = (Std Dev of Mean Calculated Concentration/Mean Calculated Concentration) x100

6.2 Acceptance Criteria for QCs

Acceptance criteria for QC samples are based on precision and accuracy and should fulfil the following conditions:

Precision and accuracy is deemed acceptable if at least 66.7% (4 out of 6) of all QC samples within a run and 50% at each concentration level demonstrate precision of ≤ 30% CV and accuracy of ±≤ 35% RE.

Appendix 1

6.3 Acceptance Criteria for Analytical Assay Runs

A standard curve and two sets of each QC level will be included in each analytical run and will be run in duplicate (n=2). The analytical run will be accepted when conditions detailed in Section 6.1 and 6.2 are met.

6.4 Acceptance Criteria for Samples

Acceptance criteria for measurement of the samples will be a precision for the determined concentration of SARS-CoV-2 antibodies of ≤ 30% CV between replicates. Determined sample concentrations (following dilution) must be within the calibration range of 250 ng/mL to 32000 ng/mL. Precision acceptance criteria will not be applied to any samples where both replicates fall below the limit of quantification (BLQ). Only data from accepted analytical assay runs will be reported.

7 SAMPLES

7.1 Sample Receipt

Samples are expected as per the Study Protocol for 513351. Samples will be stored in a freezer set to maintain -80°C upon receipt and will be logged in as per SOP CT-030023. Full details of shipments will be recorded in the raw data and the final phase report.

7.2 Analysis of Study Samples

All murine serum samples will be measured using the validated method.

Samples should undergo no more than the 2 FT cycles. During analysis samples should be retained at room temperature for the minimum time possible; the positive control anti-SARS-CoV-2 antibody has been demonstrated to be stable in murine serum stored at room temperature for at least 24 hours.

The stability of immunoglobulins in serum when stored at -80°C is well documented in the literature and as such long-term stability assessment is not being conducted.

7.3 Disposal of Study Samples

Sample storage and disposal procedures will be carried out in accordance with SOP CT-030023 and the protocol for Study 513351.

Appendix 1

Test Site Identifier: 2020-AZD1222-0217
Study Number: 513351

8 REPORTING

The final phase report will include, but not necessarily be limited to, the following:

- Analytical Study Title (Including Study Number and Test Site Identifier)
- Name and Address of Study Sponsor, Test Facility and Principal Investigator

9 STANDARD OPERATING AND ARCHIVING PROCEDURES

9.1 Standard Operating Procedures

This phase will be conducted according to AstraZeneca Standard Operating Procedures.

9.2 Maintenance of Records

Records of all test measurements, analyses and events that relate to the phase will be maintained in the phase file and associated data files. Electronic records of raw and processed data files associated with the phase will be maintained on the AstraZeneca GLP file share until such time that they are backed-up according to SOP IT-030097.

Upon completion of the analytical phase, records (paper and electronic) will be archived according to SOP RM-030071. All physical raw data and phase related documents generated during the course of the phase, including a copy of the phase plan and report, will be stored initially in the archive at AstraZeneca, Milstein Building, Granta Park, Cambridge, CB21 6GH, UK. Periodically phase and non-phase specific records will be transferred to an off-site contract archive facility, Qualogy (Thrapston, Northants, NN14 4ZL, UK) for storage according to SOP RM-030071.

9.3 Phase Plan Amendments

Changes to this phase plan will be fully documented according to AstraZeneca SOP CT-030083 and archived along with the phase plan.

Test Site Identifier: 2020-AZD1222-0217
Study Number: 513351

10 APPENDIX 1: ASSAY PROCEDURE

10.1 Reagent Preparation

10.1.1 Preparation of Capture Reagent (SARS-CoV-2 Trimeric Spike Protein)

The capture reagent will be diluted to 3.0 µg/mL in DPBS. Capture reagent should be prepared immediately prior to use.

10.1.2 Preparation of Detection Reagent

The detection reagent (SULFO-TAG labelled goat anti-mouse antibody) stock will be diluted to 1.0 µg/mL in assay diluent (Blocker Casein in PBS). Detection reagent should be prepared immediately prior to use.

10.1.3 Preparation of 0.1% Tween 20 in PBS Wash Buffer

2 L of 0.1% Tween 20 in PBS Wash Buffer will be made from 20 PBS Tablets, plus 2.0 mL Tween 20 in 2 L lab grade water (volumes can be scaled up or down). The expiry date will be one week from date of preparation.

10.1.4 Preparation of 1% Matrix

Pooled mouse serum (100% matrix) will be diluted to 1% matrix in assay diluent (Blocker Casein in PBS).

10.1.5 Preparation of Read Buffer B

MSD Gold Read Buffer B will be neat used as supplied.

10.2 Preparation of Samples and Controls

All samples and controls will be subject to the 100-fold MRD in assay diluent (Blocker Casein in PBS) prior to analysis.

Where required, samples may undergo further dilution in 1% murine serum, as detailed in Section 5.6.

Appendix 1

Test Site Identifier: 2020-AZD1222-0217

10.3 Assay Procedure

Procedure		Performed by: Initial/date
1.	Coat MSD 96 well high bind plate with 25 µL per well of Trimer at 3 µg/mL in DPBS. Seal the plate and incubate overnight at 2-8°C.	Step 1
2.	Wash the plate 3x with 300 µL per well of Wash Buffer and blot dry. Block plate with 150 µL per well of Blocker Casein in PBS, seal the plate and incubate for at least 30 minutes on a plate shaker set at 25°C and shaking at 700 rpm. Incubation Start Time:_____ Incubation End Time:_____ Total Incubation Time:_____ Shaker ID:_____ Washer ID:_____	Steps 2 to 5
3.	Wash the plate 3x with 300 µL per well of Wash Buffer and blot dry. Add 50 µL per well of calibration or QC/test sample to the plate. Seal the plate and incubate on a plate shaker set at 25°C and shaking at 700 rpm for 120 ± 10 minutes. Incubation Start Time:_____ Incubation End Time:_____ Total Incubation Time:_____ Shaker ID:_____ Washer ID:_____	
4.	Wash the plate 3x with 300 µL per well of Wash Buffer and blot dry. Add 50 µL per well of Detection Reagent. Seal the plate and incubate on a plate shaker set at 25°C and shaking at 700 rpm for 60 ± 5 minutes. Incubation Start Time:_____ Incubation End Time:_____ Total Incubation Time:_____ Shaker ID:_____ Washer ID:_____	
5.	Wash the plate 3x with 150 µL per well of Wash Buffer and blot dry. Add 150 µL per well of Read Buffer B and read on MSD S 600 within 10 minutes. Time Read Buffer added:_____ Time Plate Read:_____ Total Time:_____ Washer ID:_____

1. OBJECTIVE(S)

AZD1222 is a recombinant, replicant defective adenovirus (ChAdOx1 nCov-19) expressing the SARS-CoV-2 spike (S) surface glycoprotein which is under development by AstraZeneca as a potential COVID-19 disease prevention vaccine. The objective of this study is to determine the potential toxicity of AZD1222 when given by intramuscular injection intermittently (on Days 1, 22 and 43) to mice with a minimum 28 day recovery period to evaluate the potential reversibility of any findings. In addition the antibody response will be evaluated.

1.1. Study Classification

Study Category:	Toxicology
Study Type:	Repeat Dose Toxicity
Study Design:	Parallel
Primary Treatment CAS Registry Number:	Not Available
Primary Treatment Unique Ingredient ID:	Not Available
Class of Compound:	Not Available

2. PROPOSED STUDY SCHEDULE

Proposed study dates are listed below. Actual applicable dates will be included in the Final Report.

Experimental Start Date:	01 Sep 2020 (First date of study-specific data collection)
Experimental Completion Date:	Jan 2021 (Last date data are collected from the study)
Animal Arrival/Transfer:	25 Aug 2020
Initiation of Dosing:	08 Sep 2020
Completion of In-life:	
Main Study:	22 Oct 2020
Recovery:	20 Nov 2020 (Dates of necropsy)
Immunogenicity Sample Despatch:	Delivery 1: 30 Sep 2020 Delivery 2: 21 Oct 2020 Delivery 3: 23 Nov 2020
Clinical Pathology Review (Main Study):	05 Nov 2020 (10 business days from first necropsy)
Clinical Pathology Review (Recovery):	04 Dec 2020 (10 business days from last necropsy)
Audited Draft Immunogenicity Report:	To be added by amendment

Appendix 1

Irwin Measurements Draft Report:	15 Dec 2020 (50 business days from the Day 29 Irwin measurement)
Main Study Pathology Draft Report and Slides Available for Sponsor Peer Review:	27 Nov 2020 (32 business days from first necropsy)
Full Pathology Draft Report (including recovery) and Slides Available for Sponsor Peer Review:	24 Dec 2020 (24 business days from last necropsy)
Pathology Draft Report after Sponsor Peer Review:	19 Jan 2021 (38 business days from last necropsy)
Unaudited Draft Report:	28 Jan 2021 (45 business days from last necropsy)
Receipt of Sponsor Comments:	11 Feb 2021 (55 business days from last necropsy)
Audited Draft Report:	25 Feb 2021 (65 business days from last necropsy)
Finalization of Phase Reports and final set of Sponsor Comments:	04 Mar 2021 (70 business days from last necropsy)
Final Report:	11 Mar 2021 (75 business days from last necropsy) (Expected date of Study Director signature)

3. GUIDELINES FOR STUDY DESIGN

The design of this study was based on the study objective(s), the overall product development strategy for the test item, and the following study design guidelines:

- ICH Harmonised Tripartite Guideline S7A. *Guideline on Safety Pharmacology Studies for Human Pharmaceuticals*.
- Committee for Medicinal Products for Human Use (CHMP). *Note for Guidance on Repeated Dose Toxicity*. CPMP/SWP/1042/99rev1.
- ICH Harmonised Tripartite Guideline M3 (R2). *Nonclinical Safety Studies for the Conduct of Human Clinical Trials and Marketing Authorisation for Pharmaceuticals.*
- WHO Guideline on Nonclinical Evaluation of Vaccines, Nov 2005, and WHO Guideline on the Nonclinical Evaluation of Vaccine Adjuvants and Adjuvanted vaccines Oct 2013.
- FDA: Guideline for Industry: Considerations for Development Toxicity Studies for Preventive and Therapeutic Vaccines for Infectious Disease Indications 2006, and Development and Licensure of Vaccines to Prevent COVID-19: Guidance for Industry; Center for Biologics Evaluation and Research; June 2020.
- OECD Series on Principles of Good Laboratory Practice and Compliance Monitoring. Number 13. *Consensus Document of the Working Group on Good Laboratory Practice. The Application of the OECD Principles of GLP to the Organisation and Management of Multi-Site Studies*.

Appendix 1

4. REGULATORY COMPLIANCE

This study will be performed in accordance with the OECD Principles of Good Laboratory Practice as incorporated into the United Kingdom Statutory Instrument for GLP and as accepted by Regulatory Authorities throughout the European Union, United States of America (FDA and EPA) and Japan (MHLW, MAFF and METI), and other countries that are signatories to the OECD Mutual Acceptance of Data Agreement.

Exceptions to GLP include the following:

- Pathology Peer Review

5. QUALITY ASSURANCE

5.1. Test Facility

The Test Facility Quality Assurance Unit (QAU) will monitor the study to assure the facilities, equipment, personnel, methods, practices, records, and controls are in conformance with Good Laboratory Practice regulations. The QAU will review the protocol, conduct inspections at intervals adequate to assure the integrity of the study, and audit the Final Report to assure that it accurately describes the methods and standard operating procedures and that the reported results accurately reflect the raw data of the study.

The Test Facility QAU contact for this study is indicated below:

s 22

5.2. Sponsor

The conduct of the following study phase(s) will be audited by the Sponsor QAU(s):

- Immunogenicity

Inspections will be 'to be added by amendment' based and performed per Test Site SOP. For all study phases inspected by Sponsor or Sponsor subcontractor QAU(s), copies of each periodic inspection report will be made available to the Study Director, Test Facility Management and Test Facility QAU.

6. COMMUNICATION

The Study Director will send an electronic version of the study plan (Final Protocol) and any amendments (signed by the Study Director and, when applicable, Test Facility Management) to the Sponsor Representative (Study Monitor), Alternative Sponsor Contact, Clinical Pathology Reviewer (if applicable), s 22 and to each Monitoring Scientist.

Appendix 1

Appendix 1

Irwin Measurements s 22

Each IS is required to report any deviations or other circumstances that could affect the quality or integrity of the study to the Study Director in a timely manner. Each IS will provide a report addressing their assigned phase of the study, which will be included as an appendix to the Final Report. The phase report will include the following:

- A listing of critical computerised systems used in the conduct and/or interpretation of the assigned study phase

Principal Investigators (PI) at Test Site

Immunogenicity s 22

The PI's reference number for this phase of the study will be added by amendment.

Each PI is required to report any deviations or other circumstances that could affect the quality or integrity of the study to the Study Director in a timely manner. Each PI will provide a report addressing their assigned phase of the study, which will be included as an appendix to the Final Report. A draft of the phase report will be submitted to the Study Director for review prior to finalisation. The phase report will include the following:

- A Statement of Compliance
- A QA Statement
- The archive site for all records, samples, specimens and reports generated from the phase or segment (alternatively, details regarding the retention of the materials may be provided to the Study Director for inclusion in the Final Report)
- A listing of critical computerised systems used in the conduct and/or interpretation of the assigned study phase

9. TEST AND CONTROL ITEMS

9.1. Test Item(s)

Identification: AZD1222

Alternative Identification: ChAdOx1-nCovd-19

Supplier: To be added by amendment

Batch (Lot) Number: To be added by amendment

Batch Release Date: To be added by amendment

Expiration Date: To be added by amendment

Viral Particle Concentration: 5.33x10^11/mL

Storage Conditions: In a freezer at approximately -80°C.

Administration Dose Form: Solution

9.2. Control Item Components

Identification: To be added by amendment

Composition: 10 mM histidine, 7.5% (v/w) sucrose, 35 mM sodium chloride, 1 mM magnesium chloride, 0.1% (v/w) Polysorbate-80, 0.1 mM EDTA and 0.5% (v/w) ethanol, pH 6.6, in water for injection

Appendix 1

Supplier:	To be added by amendment
Batch (Lot) Number:	To be added by amendment
Expiration Date:	To be added by amendment
Storage Conditions:	In a freezer at approximately -80°C.

9.3. Test and Control Item Characterisation

The Sponsor will provide to the Test Facility documentation of the identity, strength, purity, composition and stability for the test item. A Test Item (Compound) Characterisation Summary (TICS) and Test formulation Summary (TFS) or equivalent documentation will be provided for retention in the raw data.

The Sponsor has appropriate documentation on file concerning the method of synthesis, fabrication or derivation of the test and control item(s), and this information is available to the appropriate regulatory agencies should it be requested.

9.4. Analysis of Test Item

The stability of the bulk test item will not be determined during the course of this study. Information to support the stability of each lot of the bulk test item will be provided by the Sponsor.

9.5. Reserve Samples

A reserve sample will not be retained at the Test Facility as the Sponsor has indicated that they will retain a reserve sample.

9.6. Test and Control Item Inventory and Disposition

Records of the receipt, distribution, and storage of test and control items will be maintained. The quantity of test item/control item remaining will be communicated to the Study Monitor, who will decide if it should be discarded or returned to the Sponsor.

Shipping Contact

10. SAFETY

Safety instructions for this study are provided on the Sponsor supplied safety data sheet. COSHH assessment and classification will be carried out at the Test Facility on a Chemical Classification Spreadsheet.

Appendix 1

11. DOSE FORMULATION AND ANALYSIS

11.1. Preparation of Control Item

The control item, to be added by amendment, will be dispensed as required. The control item will be removed from the freezer on the morning of dosing and delivered to the animal unit on 'wet' ice. On arrival at the animal unit, dosing vials will be allowed to reach room temperature before dosing.

Thawed vials cannot be re-frozen or re-used and will be disposed of after being used for dosing formulation preparation.

Any residual volumes will be discarded unless otherwise requested by the Study Director.

11.2. Preparation of Test Item

The test item, AZD1222, will be administered as received. The required number of vials will be removed from the freezer on the morning of dosing and delivered to the animal unit on 'wet' ice. On arrival at the animal unit, dosing vials will be allowed to reach room temperature before dosing.

Thawed vials cannot be re-frozen or re-used and will be disposed of after use.

Any residual volumes will be discarded unless otherwise requested by the Study Director.

11.3. Sample Collection and Analysis

The test and control items will be used as received from the Sponsor; therefore, samples for dose formulation analysis will not be collected by the Test Facility.

12. TEST SYSTEM

Species:	Mouse
Strain:	CD-1 Crl:CD-1 (ICR)
Condition:	Purpose-bred, naive
Source:	Charles River UK Limited, Margate, Kent, UK
Number of Males Ordered:	88 (including 3 extras)
Number of Females Ordered:	88 (including 3 extras)
Target Age at the Initiation of Dosing:	7-8 weeks
Target Weight at the Initiation of Dosing:	20-40 g

The actual age and weight of animals will be listed in the Final Report.

12.1. Justification of Test System and Number of Animals

The mouse was chosen as the animal model for this study as it is a rodent species accepted by regulatory agencies for toxicity testing.

Appendix 1

The total number of animals to be used in this study is considered to be the minimum required to properly characterise the effects of the test item. This study has been designed such that it does not require an unnecessary number of animals to accomplish its objectives.

12.2. Animal Identification

At study assignment, each animal will be identified using a subcutaneously implanted electronic cylindrical, 'glass-sealed' TROVAN microchip.

12.3. Environmental Acclimation

The animals will be allowed to acclimate to the Test Facility rodent toxicology accommodation for a period of up to 3 weeks (minimum of one week) before the commencement of dosing.

12.4. Selection, Assignment, Replacement and Disposition of Animals

Males and females will be randomised separately.

Cages will be racked by dose group and arranged vertically throughout the rack. Control animals will be housed on a separate rack.

Before the initiation of dosing, any assigned animals considered unsuitable for use in the study will be replaced by alternative animals obtained from the same shipment and maintained under the same environmental conditions.

After initiation of dosing, study animals may be replaced during the replacement period with alternative animals in the event of accidental injury, non-test item-related health issues, or similar circumstances.

The alternative animals may be used as replacements on the study within 3 days.

The disposition of all animals will be documented in the study records.

13. HUSBANDRY

13.1. Housing

Males will be housed individually and females will be housed 2 or 3 per cage (unless reduced by mortality) in solid bottom polyethermide plastic cages with wire bar lid.

Bedding material will be sterilised white wood shavings which will be provided with a certificate of analysis for significant contaminants. An analytical certificate for each batch of bedding used will be retained at the Test Facility.

There are no known contaminants in the bedding that would interfere with the objectives of the study.

13.2. Environmental Conditions

The targeted conditions for animal room environment will be as follows:

Temperature: 19 - 23°C

Appendix 1

Humidity:	40 - 70%
Ventilation:	A minimum of 10 air changes per hour
Light Cycle:	12 hours light and 12 hours dark (except when interrupted by study procedures/activities)

There will be automatic control of temperature and humidity which will be continuously monitored and recorded. Information on actual temperature and humidity ranges versus target ranges will be presented in the study report.

The light cycle will be controlled automatically.

13.3. Food

SDS Rat and Mouse No. 1 Diet SQC Expanded will be provided *ad libitum* throughout the study, except during designated procedures. The same diet in meal form may be provided to individual animals as warranted by clinical signs (e.g. broken/damaged incisors or other health changes).

The feed is analysed by the supplier for nutritional components and environmental contaminants. Results of the analysis are provided by the supplier and will be retained at the Test Facility.

There are no known contaminants in the feed that are considered to interfere with the objectives of the study.

13.4. Water

The animals will have access to water *ad libitum* from the public supply from water bottles which will be changed as necessary throughout the course of the study.

The water used by the Test Facility is analysed at regular intervals for dissolved materials, heavy metals, pesticide residues, pH, nitrates and nitrites. Microbiological screening is also conducted. An analytical certificate for each analysis will be retained at the Test Facility.

The water used is considered not to contain any additional substances, in sufficient concentration, to have any influence on the outcome of the study.

13.5. Animal Enrichment

For psychological/environmental enrichment, males will be provided with items such as a device for hiding in and an object for chewing, except when interrupted by study procedures/activities.

Females will be socially housed for psychological/environmental enrichment and will be provided with items such as a device for hiding in and an object for chewing, except when interrupted by study procedures/activities.

Objects for chewing and devices for hiding in will be provided with a certificate of analysis for significant contaminants. An analytical certificate for each batch of chewing objects and devices for hiding used will be retained at the Test Facility.

Appendix 1

Other items may be included to enrich the cage environment. Details will be given in the study report.

13.6. Veterinary Care

Veterinary care will be available throughout the course of the study and animals will be examined by the veterinary staff as warranted by clinical signs or other changes. All veterinary examinations and recommended therapeutic treatments, if any, will be documented in the study records.

In the event that animals show signs of illness or distress, the responsible veterinarian may make initial recommendations about treatment of the animal(s) and/or alteration of study procedures, which must be approved by the Study Director or by Test Facility management if the Study Director is not available, except where detailed below where immediate action is required to address a potentially life-threatening situation, or to alleviate acute severe pain. All such actions will be documented in the study records and, when appropriate, by protocol amendment. Treatment of the animal(s) for minor injuries or ailments may be approved without prior consultation with the Sponsor representative when such treatment does not impact fulfilment of the study objectives. If the condition of the animal(s) warrants significant therapeutic intervention or alterations in study procedures, the Sponsor representative will be contacted, when possible, to discuss appropriate action. If the condition of the animal(s) is such that emergency measures must be taken, the Study Director and/or attending veterinarian will attempt to consult with the Sponsor representative prior to responding to the medical crisis, but the Study Director and/or veterinarian has authority to act immediately at his/her discretion to alleviate suffering. The Sponsor representative will be fully informed of any such events.

Appendix 1

14. EXPERIMENTAL DESIGN

Experimental Design

Group No.	Animal Numbers					
	Main Study		Recovery		Immunogenicity	
	Males	Females	Males	Females	Males	Females
1	1001-1020	1501-1520	1101-1120	1601-1620	-	-
2	2001-2020	2501-2520	2101-2120	2601-2620	2201-2205	2701-2705

Extra animals will be numbered 3001-3003M and 3501-3503F
- = Not applicable

Group No.	Dose Volume[a] (µL)	Total Viral Particle (VP)/dose	Viral Particle (VP) Concentration per 1 mL
1	70	0	0
2	70	3.73×10^{10}	5.33x10^11

[a] 35 µL will be administered in the thigh muscle of each hind limb on each dosing occasion (total dose volume = 0.07 mL)

14.1. Administration of Test and Control Items

The test or control items will be administered to the appropriate animals by intramuscular injection (dose split across two dose sites) on Days 1, 22 and 43. The first day of dosing will be designated as Day 1. The dosing formulations will be allowed to reach room temperature before administration. Animals will generally be dosed during the morning.

The doses will be given using a graduated syringe and sterile hypodermic needle (details of the gauge and type of needle used will be retained in the raw data).

Each hindlimb will receive 0.035 mL, total dose of 0.07 mL.

Left hindlimb = Site 1

Right hindlimb = Site 2

The administration sites will be clipped free of hair before the first injection. The injection site will be marked. Further clipping and marking will occur as necessary to maintain visibility of each site.

14.2. Recovery Period

On completion of the dosing period, the designated recovery animals will be retained for a minimum 28 day recovery period.

14.3. Justification of Route and Dosage Levels

The intramuscular injection route of administration has been selected for this study as this route has been defined by the Sponsor as the route of clinical application.

Appendix 1

Regulatory guidelines indicate that the highest proposed clinical dose should be evaluated in the animal model, and an additional dose included (n+1). For this vaccine the clinical dose is not expected to exceed 5x10^10 virus particles/dose with the number of dosing occasions being 2. However, as the dose is limited by the volume that can be administered by intramuscular injection to mice, the maximum feasible dose of 3.73x10^10 virus particles will be given. On a body weight basis, this exceeds the human exposure by >1000x, assuming 50 kg human and 50 g mouse. Previous data generated for the Sponsor indicated that 1.7x10^10 virus particles/dose in mice induced an appropriate immune response. Charles River Study No. 490838 [1] has shown that 2.6x10^10/dose produced no in-life adverse signs of toxicity.

15. IN-LIFE PROCEDURES, OBSERVATIONS, AND MEASUREMENTS

15.1. Mortality/Moribundity Checks

Frequency: Twice daily, once at the start and once towards the end of the working day throughout the study.

Procedure: Animals will be observed for general health/mortality and moribundity. Animals will not be removed from the cage during observation, unless necessary for identification or confirmation of possible findings.

15.2. Clinical Observations

15.2.1. Detailed Clinical Observations

Frequency: Weekly, beginning Week -1.

Procedure: Animals removed from the cage for examination.

15.2.2. Pre and Post dose Observations

Frequency: Regularly throughout the day on dosing days. On non-dosing days, signs will be recorded at least once.

Procedure: All the animals will be examined for reaction to AZD1222. The onset, intensity and duration of these signs will be recorded (if appropriate). Control animals will be similarly examined for comparison.

15.3. Body Temperature

Frequency: Pretreatment – once; Dosing Period – Day 1, 4 hours post dose (±1 hour)

Procedure: The rectal temperature of 10 male and 10 female main study animals will be recorded.

Appendix 1

15.4. Body Weights

Frequency:	Once pretreatment, on each dosing Day (Days 1, 22 and 43) and 3 days after the first and second dosing occasion (i.e. Days 2-4, 23-25) and for two days after the third dosing occasion (i.e. Day 44-45) Twice weekly during non-dosing weeks.
Procedure:	Animals will be individually weighed. A weight will be recorded on each day of scheduled necropsy.

15.5. Food Consumption

Frequency:	Once during pretreatment Day 1, Day 22, Day 43 (i.e. Days 1-2, 22-23 and 43-44). Twice weekly during non-dosing weeks.
Procedure:	Food consumption will be quantitatively measured.

15.6. Dermal Scoring

Frequency:	Each dosing occasion: Predose, 4 h post dose, then daily until any reaction is resolved and at termination.
Procedure:	Skin will be assessed for erythema and eschar formation, oedema formation and any other reaction to treatment.

15.7. Modified Irwin Screen Observations

On Days 8 and 29, the first six males per group (main study animals) will be observed and the following parameters will be included in the observations:

Occurrence of vocalisation, stereotypies, aggressiveness, abnormal gait, straub tail, abducted hind limbs, tremor, twitches, convulsions, body posture, sedation, catalepsy, ptosis, exophthalmos, salivation, lacrimation, piloerection, abnormal respiration, defecation, urination and death.

Increase or decrease of spontaneous activity, touch response and body tonus. Increase of sniffing, grooming, scratching and rearing.

Decreased pinna reflex, traction response and grip strength. Any additional symptoms observed will also be noted.

Frequencies of animals exhibiting symptoms will be recorded. Symptoms will be scored from 0 to 3, where 0 represent no findings and 3 the highest score.

Pupil size will be measured using a guidance chart to estimate the size in millimetres.

Body temperature will be measured by using a probe inserted approx. 2 cm past the anal sphincter. At least 30 minutes prior to the commencement of observations, to reduce measurement variability, a temperature habituation trial will be conducted by inserting the temperature probe, however, no temperature data will be collected during this trial.

Appendix 1

15.7.1. Apparatus

The traction response will be measured by assessing the ability of mice to pull themselves up onto a cage top.

Grip strength will be assessed by allowing mice to grip onto the cage lid. Hold the mouse and let it grip onto the grid with all paws and then gently pull the mouse backwards from the lid.

A proforma with a size scale will be used for assessing relative pupil sizes only and no exact sizes will be calculated or implied.

A thermometer, with a flexible probe, will be used to measure body temperature.

16. LABORATORY EVALUATIONS

16.1. Clinical Pathology

16.1.1. Blood Sample Collection

Blood will be collected from the orbital sinus under non-recoverable isoflurane anaesthesia, in ascending animal order unless samples are collected prior to necropsy where the order of euthanasia will be followed. Animals will not be fasted.

After collection, samples will be transferred to the appropriate laboratory for processing.

Samples will be collected according to the following table.

Appendix 1

Samples for Clinical Pathology Evaluation

Group Nos.	Time Point	Haematology	Plasma Chemistry
First 10 numbered Main Study animals per sex per group	Day 45	X	-
Second 10 numbered Main Study animals per sex per group		-	X
First 10 numbered Recovery animals per sex per group	Day 74	X	-
Second 10 numbered Recovery animals per sex per group		-	X
Unscheduled euthanasia of whole group (when possible)	Before euthanasia	X	X

X = sample to be collected; - = not applicable. Individual premature decedents will not be sampled.

Any residual/retained clinical pathology samples will be discarded following approval of the results by Charles River Clinical Pathology Department, and before issue of the Final Report.

16.1.2. Haematology

Target Volume: 0.3 mL

Anticoagulant: K_2EDTA

Haematology Parameters

Red blood cell count Haemoglobin Haematocrit Mean corpuscular volume Mean corpuscular haemoglobin concentration Mean corpuscular haemoglobin Reticulocytes (%) Reticulocyte count (absolute)	Red blood cell distribution width Platelet count White blood cell count Neutrophil count (absolute) Lymphocyte count (absolute) Monocyte count (absolute) Eosinophil count (absolute) Basophil count (absolute) Large unstained cells Blood Smear (see ^ below)

^ A blood smear will be prepared from each haematology sample. Blood smears will be labelled, stained, and stored. Individual blood smears may be examined to confirm certain analyser results, as required by SOP.

If additional examination of blood smears is deemed necessary, the smears may be subsequently evaluated and this evaluation will be described in a protocol amendment.

Appendix 1

Morphology findings that require confirmation, as required by SOP, will be reviewed by a clinical pathologist in Charles River.

16.1.3. Plasma Chemistry

Target Volume: As much as possible (no more than 1.0 mL required)

Anticoagulant: Lithium Heparin

Processing: To plasma

Plasma Chemistry Parameters

Aspartate aminotransferase Alanine aminotransferase Alkaline phosphatase Glutamate dehydrogenase Total protein Albumin Globulin Total bilirubin[a] Urea Creatinine Cholesterol Glucose	Triglycerides Phosphate Calcium Total Bile Acids Sodium Potassium Chloride Albumin/globulin ratio Lipaemia (visual qualitative assessment) Icterus (visual qualitative assessment) Haemolysis (Visual Qualitative Assesment)
[a] When total bilirubin is >8.55µmol/L, indirect and direct bilirubin will also be measured	

16.1.4. Bone Marrow Smear Evaluation

Bone marrow smears will be collected as described in the Tissue Collection and Preservation table (Section 17.5). Evaluation of stained smears may be added by amendment at the discretion of the Study Director in consultation with the pathologist and the Sponsor.

16.2. Immunogenicity Evaluation

16.2.1. Immunogenicity Sample Collection

Blood will be collected from the saphenous vein of all immunogenicity animals using a suitably sized needle.

Samples will be collected on the following occasions.

Pretreatment, Day 22 (before dosing), Day 43 (before dosing) and Day 74 (at termination).

Target Volume: 0.2 mL

Anticoagulant: None

16.2.2. Immunogenicity Sample Processing

Samples will be allowed to clot at ambient temperature for at least 60 minutes before centrifugation. The samples will be centrifuged at 1500 *x* g for 10 min in a centrifuge set to 4°C and the resultant serum will be separated, transferred to uniquely labelled clear polypropylene

Appendix 1

tubes, and frozen immediately over dry ice before being transferred and stored in a freezer set to maintain -80°C.

Serum tube labelling: All serum samples will be marked with the study number, animal number, group number and experimental day number.

Samples will be shipped after Day 22, 43 and 74 on dry ice to the following address.

Shipping Contact

The analytical laboratory will be notified before shipment of the samples. Upon receipt at the bioanalytical laboratory, the samples will be stored in a freezer set to maintain -80°C.

16.2.3. Immunogenicity Sample Analysis

To be added by amendment

Appendix 1

17. TERMINAL PROCEDURES

Terminal procedures are summarised in the following table:

Terminal Procedures for Main Study and Recovery Animals

Group Number	Number of Animals		Scheduled Euthanasia Day	Necropsy Procedures			Histology[b]	Histopathology[b]
	M	F		Necropsy	Tissue Collection	Organ[a] Weights		
1	20	20	45 (main study)	X	X	X	Full Tissue or Blocks only[c]	Full Tissue[d]
2	20	20					Full Tissue or Blocks only[c]	Full Tissue[d]
1	20	20	74 (recovery)	X	X	X	Full Tissue or Blocks only[c]	Full Tissue[d]
2	20	20					Full Tissue or Blocks only[c]	Full Tissue[d]
Unscheduled Deaths				X	X	-	Full Tissue	Full Tissue

X = procedure to be conducted; - = not applicable; Block = processed tissue to wax cassette.
[a] See Tissue Collection and Preservation table for listing of weights.
[b] See Tissue Collection and Preservation table for listing of tissues.
[c] Tissues from the remaining 10 animals will be processed to wax block and stored pending possible future evaluation, which will be documented in a protocol amendment, if required.
[d] Only tissues from the first 10 animals/sex/group will be evaluated histopathologically.

17.1. Unscheduled Deaths

If a main study or recovery animal dies on study or is killed for humane reasons, a necropsy will be conducted and specified tissues will be saved. If necessary, the animal will be refrigerated to minimise autolysis.

Main study or recovery animals may be euthanised for humane reasons as per Test Facility SOPs. The body weight will be recorded and samples for evaluation of clinical pathology parameters (if an entire group of animals are euthanised) will be obtained if possible as specified in Section 16. These animals will undergo necropsy, and specified tissues will be retained. If necessary, the animal will be refrigerated to minimise autolysis.

Immunogenicity animals that die on study or are euthanised for humane reasons will have blood sample collected for immunogenicity analysis as specified in Section 16. The animal will be subjected to necropsy examination as detailed in Section 17.3 and tissues will be retained without evaluation. If required, evaluation will be documented in a protocol amendment.

17.2. Scheduled Euthanasia

Main study and recovery animals surviving until scheduled euthanasia will have a terminal body weight recorded, and will be euthanised by exposure to a rising concentration of carbon dioxide followed by exsanguination. When possible, the animals will be euthanised in a rotating order across dose groups such that similar numbers of AZD1222 and control animals will be necropsied throughout the day. Animals will not be fasted before their scheduled necropsy.

Appendix 1

Immunogenicity animals surviving until scheduled euthanasia will be euthanised by an approved method. No necropsy will be performed and no tissues will be collected.

17.3. Necropsy

Main and recovery animals will be subjected to a complete necropsy examination, which will include evaluation of the carcass and musculoskeletal system; all external surfaces and orifices; cranial cavity and external surfaces of the brain; and thoracic, abdominal, and pelvic cavities with their associated organs and tissues. Macroscopic abnormalities will be recorded. Necropsy examinations will be conducted by a trained technician and will consist of an external and internal examination and recording of observations for all animals. A veterinary pathologist will be available for consultation during normal working hours.

At the discretion of the necropsy supervising pathologist, images may be generated for illustration of or consultation on gross observations. Generation of such images will be documented and communicated to the Study Director. Images and associated documentation will be retained and archived.

Any remaining tissues not required for histopathology or retention may be harvested from the carcass of control animals before disposal. These tissues, if collected, may be used for validation or investigational purposes and as such are not part of this study.

17.4. Organ Weights

The organs identified for weighing in the Tissues Collection and Preservation table will be weighed at necropsy (unless otherwise specified) for all scheduled euthanasia animals. Organ weights will not be recorded for animals found dead or euthanised in poor condition or in extremis. Paired organs will be weighed together. In the event of gross abnormalities, in addition to the combined weight, the weight of each organ of a pair may be taken and entered as a tissue comment. Terminal body weights will be used for organ weight analysis.

17.5. Tissue Collection and Preservation

Representative samples of the tissues identified in the Tissue Collection and Preservation table will be collected from all animals and preserved in 10% neutral buffered formalin, unless otherwise indicated. Additional tissue samples may be collected to elucidate abnormal findings.

Tissue Collection and Preservation

Tissue	Weigh	Collect	Microscopic Evaluation	Comment
Administration site 1	-	X	X	Left thigh
Administration site 2	-	X	X	Right thigh
Animal identification	-	X	-	-
Artery, aorta	-	X	X	From thoracic segment.

Appendix 1

Tissue	Weigh	Collect	Microscopic Evaluation	Comment
Bone marrow smear	-	X	-	Two bone marrow smears will be collected from the femur at scheduled and unscheduled necropsies (for possible examination). Smears will not be collected from animals that are found dead or from animals that were euthanised moribund and then stored in the refrigerator prior to necropsy. Bone marrow smears are allowed to air dry and are fixed in Methanol.
Bone marrow, sternum	-	X	X	Collect with bone, sternum.
Bone, femur	-	X	X	Collect distal end to include femorotibial joint.
Bone, sternum	-	X	X	-
Brain	X	X	X	Eight brain levels to be examined to include caudal part of olfactory bulb (Bolon sections). Olfactory bulbs (OB) to be severed from the brain at necropsy and left to fix in the skull with calvarium removed; OB removed from skull at trimming for processing and embedding.
Cervix	-	X	X	Collect with uterus.
Epididymis x 2	X	X	X	Preserve in Modified Davidson's fixative.
Eye x 2	-	X	X	Preserve in Davidson's fixative.
Gland, adrenal x 2	X	X	X	-
Gland, harderian x 2	-	X	X	-
Gland, mammary	-	X	X	Collect with inguinal skin. Examine in males only if present on routine section of inguinal skin.
Gland, parathyroid x 2	-	X	X	Collect with gland, thyroid. Examine only if present in the routine section of gland, thyroid.
Gland, pituitary	X	X	X	-
Gland, prostate	X	X	X	-
Gland, salivary x2	-	X	X	Mandibular.
Gland, salivary x2	-	X	X	Parotid.
Gland, seminal vesicle	-	X	X	Left and right horns.
Gland, thyroid x2	-	X	X	-
Gross lesions/masses	-	X	X	Include local draining lymph nodes to masses.
Heart	X	X	X	-
Kidney x 2	X	X	X	-
Large intestine, caecum	-	X	X	-
Large intestine, colon	-	X	X	-
Large intestine, rectum	-	X	X	-
Liver	X	X	X	-
Lung	X	X	X	Infuse with 10% neutral buffered formalin after weighing. If a lung infection is suspected at necropsy, diagnostic tissue samples should be taken for bacteriology.
Lymph node, inguinal	-	X (2)	X	Left and right nodes.
Lymph node, mandibular	-	X	X	-
Lymph node, mesenteric	-	X	X	-
Muscle, skeletal	-	X	X	From gastrocnemius.
Nerve, optic x 2	-	X	X	Preserve in Davidson's fixative. Examine only if present in the routine section of the eye.
Nerve, sciatic	-	X	X	-

Appendix 1

Tissue	Weigh	Collect	Microscopic Evaluation	Comment
Oesophagus	-	X	X	-
Ovary x 2	X	X	X	-
Oviduct x 2	-	X	X	Collect with uterus.
Pancreas	-	X	X	-
Skin	-	X	X	Collect with gland, mammary
Small intestine, duodenum	-	X	X	-
Small intestine, ileum	-	X	X	Including Peyer's Patch
Small intestine, jejunum	-	X	X	-
Spinal cord	-	X	X	Cervical, thoracic and lumbar.
Spleen	X	X	X	-
Stomach	-	X	X	Glandular and non-glandular regions.
Testis x 2	X	X	X	Preserve in Modified Davidson's fixative.
Thymus	X	X	X	-
Tongue	-	X	X	-
Trachea	-	X	X	-
Ureter x 2	-	X	X	-
Urinary bladder	-	X	X	Distend contracted bladders by infusing with 10% neutral buffered formalin.
Uterus	X	X	X	-
Vagina	-	X	X	-

X = procedure to be conducted; - = not applicable.

18. HISTOLOGY AND HISTOPATHOLOGY

18.1. Histology

Tissues in the Tissue Collection and Preservation table from animals identified in the Terminal Procedures table will be embedded in paraffin, sectioned, mounted on glass slides, and stained with haematoxylin and eosin.

18.2. Histopathology

Histopathological evaluation will be performed by a veterinary pathologist with training and experience in laboratory animal pathology. Tissues identified as target tissues will be examined from animals identified in the Terminal Procedures table, by protocol amendment. Any additional stains or evaluations, if deemed necessary by the pathologist, will be added by protocol amendment following discussion with the Study Director and in consultation with the Sponsor.

At the discretion of the study pathologist and after acknowledgement by the study director, images may be captured for consultation purposes.

18.3. Pathology Peer Review

An external pathology peer review, according to the Sponsors' standard operating procedures, will be conducted by an AstraZeneca Peer Reviewing Pathologist at Astra Zeneca. The review will not claim GLP compliance.

Slides will be dispatched to:

Appendix 1

Following completion of peer review slides will be returned to the Test Facility.

The peer review statement or equivalent documentation will be included as an appendix to the Final Report.

19. COMPUTERISED SYSTEMS

The following critical computerised systems may be used in the study. Any additional critical computerised systems used during the course of the study will be added by protocol amendment. The actual critical computerised systems used will be specified in the Final Report.

Data for parameters not required by protocol, which are automatically generated by analytical devices used will be retained on file but not reported. Statistical analysis results that are generated by the program but are not required by protocol and/or are not scientifically relevant will be retained on file but will not be included in the tabulations.

Critical Computerised Systems

System Name	Description of Data Collected and/or Analysed
Dispense	Test item receipt, accountability and/or formulation activities
Provantis	Applicable in-life, clinical pathology and postmortem
To be added by amendment	Immunogenicity
In-house reporting software Nevis (using SAS)	Applicable in-life, clinical pathology and postmortem
Deviation Information Library	Deviations
Vaisala/Trend 963 Secure	Continuous temperature and humidity recording. Alarms for animal rooms, refrigerators, freezers and incubators.
Share Document Management System	Reporting
Docusign	Collection of CFR Part 11 compliant signature

20. DATA AND STATISTICAL ANALYSIS

20.1. Irwin Data Analysis

Frequencies of mice exhibiting a given symptom will be reported in tabulated form. Severity scores of the observed symptoms will be measured in four categories (0, 1, 2, or 3) and will be presented as the dose group mean of the maximal possible score [MPS=score/max score*100] for each mouse at each time point. MPS will be displayed graphically for symptoms with statistically significant findings.

Observations such as death and seizures will always be considered significant regardless of frequency. For all other symptoms the statistical analysis will be performed using SAS v9.4 (or a later version) as follows:

Appendix 1

1. Severity score will be modelled as a categorical outcome (0, 1, 2, or 3) and will be compared between Group 2 and Group 1 using a two-sided Fisher's exact test at a significance level of 20% (no multiple testing correction).

20.2. Statistical Analysis

Unless otherwise stated, all statistical tests will be two-sided and performed at the 5% significance level. Males and females will be analysed separately. Where data are collected at repeated time points, each time point will be analysed separately.

Pairwise comparisons will only be performed against the control group (Group 1). The following pairwise comparisons will be performed:

Control Group v Group 2

Body weight, food consumption, pupil size, absolute organ weights and organ weights as a percentage of terminal body weight will be analysed using a parametric ANOVA. Pairwise comparisons will be made using Dunnett's t test if the overall F-test is significant (provided there are 3 groups to compare). Datasets with two groups will be compared using a Dunnett's test (equivalent to t-test in Nevis 2012 tables).

In the ANOVA summary tables, the results of the analysis will be reported indicating the level of statistical significance ($p \leq 0.05$, $p \leq 0.01$ and $p \leq 0.001$) of each pairwise comparison.

Actual p-values will not be reported in the summary tables for these analyses.

More extensive analysis will be carried out only after consultation with the sponsor and will involve additional costs.

21. AMENDMENTS AND DEVIATIONS

Changes to the approved protocol shall be made in the form of an amendment, which will be signed and dated by the Study Director. Every reasonable effort will be made to discuss any necessary protocol changes in advance with the Sponsor.

All protocol and SOP deviations will be documented in the study records. Deviations from the protocol and/or SOP related to the phase(s) of the study conducted at a Test Site shall be documented, acknowledged by the PI, and reported to the Study Director for authorisation/acknowledgement. The Study Director will notify the Sponsor of deviations that may result in a significant impact on the study as soon as possible.

Appendix 1

22. RETENTION OF RECORDS, SAMPLES AND SPECIMENS

All study-specific raw data, electronic data, documentation, protocol, protocol amendments, retained samples and specimens, and interim (if applicable) and final reports generated by Charles River from this study will be transferred to a Charles River archive. Three years after issue of the final report, the Sponsor will be contacted to determine the disposition of materials associated with the study. The original signed copy of the final report will be archived indefinitely at the Test Facility.

Records to be maintained will include, but will not be limited to, documentation and data for the following:

- Protocol, protocol amendments, and deviations
- Study schedule
- Study-related correspondence
- Test system receipt, health, and husbandry
- Test and control item receipt, identification, preparation, and analysis
- In-life measurements and observations
- Clinical pathology sample collection and evaluation
- Immunogenicity sample collection
- Gross and microscopic observations and related data
- Organ weight measurements
- Statistical analysis results

23. REPORTING

A comprehensive Draft Report and Toxicology AZ/CTD tabulated summary will be prepared following completion of the study and will be finalised following consultation with the Sponsor. The report will include all information necessary to provide a complete and accurate description of the experimental methods and results and any circumstances that may have affected the quality or integrity of the study.

The Sponsor will receive an electronic version of the Draft and Final Report provided in Adobe Acrobat PDF format (Acrobat Versions 5 or 6 hyperlinked and searchable at final) along with a Microsoft Word version of the text. The PDF document will be created from native electronic files to the extent possible, including text and tables generated by the Test Facility. Report components not available in native electronic files and/or original signature pages will be scanned and converted to PDF image files for incorporation. An original copy of the report with the Test Facility's handwritten signatures will be retained.

Special attention will be paid to the following:

All fonts must be embedded

Appendix 1

Book marks and cross-references are created using Inherit Zoom and not Named Destinations

The PDF file is not “tagged”

Reports should be finalised within 6 months of issue of the audited Draft Report. If the Sponsor has not provided comments to the report within 6 months of draft issue, the report will be finalised by the Test Facility unless other arrangements are made by the Sponsor.

23.1. SEND Datasets

At the request of the Sponsor, SEND datasets will be generated and provided outside the context of the Final GLP Report. These datasets will not be subject to QA Audit nor will they be used as the basis for the Study Director interpretation of the study results. SEND datasets will be provided following the Draft and/or Final Report.

24. ANIMAL WELFARE

The UK Home Office controls scientific procedures on animals in the UK and does so by the issue of licences under the Animals (Scientific Procedures) Act 1986. The regulations conform to EU Directive 2010/63/EU and achieve the standard of care required by the US Department of Health and Human Services' Guide for the Care and Use of Laboratory Animals.

The Home Office licence governing this study strictly specifies the limits of severity of effects on the animals. From the available information, the procedures described in the protocol are not anticipated to cause any effects which exceed the severity limit of the procedure. Any animal which shows unacceptable reactions may be killed or other actions taken as required by the Home Office to alleviate distress.

24.1. Home Office Project Licence No.

PBAD559F8, Toxicology of Pharmaceuticals, Protocol No. 1.

Individual mortality

Explanation page

Abbreviation	Description
FD	Found dead
NR	Not recorded
REC	Recovery euthanasia
TE or TERM	Terminal euthanasia
UE or UNSC	Unscheduled euthanasia

Note: This is a comprehensive list of abbreviations. All of the abbreviations listed may not be applicable to this report.

Dosing information

Dosing information is abbreviated on various data outputs; the following represents the dosing information for this study:

Group no.	Dose volume[a] (µL)	Total viral particle (VP)/dose	Viral particle (VP) concentration per 1 mL
1	70	0	0
2	70	3.7×10^{10}	5.3 x10^11

[a] 35 µL was administered in the thigh muscle of each hind limb on each dosing occasion (total dose volume = 0.07 mL)

Individual clinical observations

Explanation page

Abbreviation	Description	Abbreviation	Description
PR	Predose	IPD	Immediately post dose
0-1H	0-1 hour post-dose	1-2H	1-2 hours post-dose
2-3H	2-3 hours post-dose	3-4H	3-4 hours post-dose
4-6H	4-6 hours post-dose	7H	7 hours post-dose
8-16H	8-16 hours post-dose	DE	Detailed examination
CSO AM or CAM	Sign of ill health or reaction to treatment observed in the morning or observation at the start of the day on non-dosing days.		
CSO PM or CPM	Sign of ill health or reaction to treatment observed in the afternoon or observation at the end of the day on non-dosing days.		
Clin obs	Clinical observations		
.	No abnormality detected, animal not examined or animal deceased.		
*	Comment present		
w/	with		
PT	Permanent		
Unsc	Unscheduled observation		
Color Not Rec	Colour not recorded		
SIRT/Cage Side Observations	Signs of ill-health in relation to treatment (post dose observations) and cage side observations.		

Note: This is a comprehensive list of abbreviations. All of the abbreviations listed may not be applicable to this report.

Only animals with clinical observations on at least one occasion are presented in this appendix.

Dosing information

Dosing information is abbreviated on various data outputs; the following represents the dosing information for this study:

Appendix 3

Group no.	Dose volume[a] (µL)	Total viral particle (VP)/dose	Viral particle (VP) concentration per 1 mL
1	70	0	0
2	70	3.7×10^{10}	5.3 x10^11

[a] 35 µL was administered in the thigh muscle of each hind limb on each dosing occasion (total dose volume = 0.07 mL)

Appendix 4

Individual body temperatures

Explanation page

Abbreviation	Description	Abbreviation	Description
DE	Pre-study recording	CAM	24 hours post Day 1 dose
4H	4 hours post-dose on Day 22	RC	Result comment

The Day 1 body temperatures were collected as 4 hours post-dose.

Note: This is a comprehensive list of abbreviations. All of the abbreviations listed may not be applicable to this report.

Dosing information

Dosing information is abbreviated on various data outputs; the following represents the dosing information for this study:

Group no.	Dose volume[a] (µL)	Total viral particle (VP)/dose	Viral particle (VP) concentration per 1 mL
1	70	0	0
2	70	3.7×10^{10}	5.3 x10^11

[a] 35 µL was administered in the thigh muscle of each hind limb on each dosing occasion (total dose volume = 0.07 mL)

Individual food consumption

Explanation page

Abbreviation	Description
AFE	Animal found with no food during measurement interval, excluded
AFNF	Animal found with no food during measurement interval
ANH	Animal found with no hopper during measurement interval
ANIC	Animal not in cage or in incorrect cage during measurement
ANW	Animal found with no water access during measurement intervals
ANWB	Animal found with no water bottle during measurement interval
AVS	Suspected aberrant value
AWE	Animal found with no water in bottle during measurement interval, excluded
FSG	Food supplementation given during interval, included in feed weight
FSNC	Food supplementation given during interval, value not calculable
NC	Not calculable
OA	Omitted activity
POWF	Powdered food
REHO	Animal rehoused during measurement interval
REPL	Animal replaced during measurement interval
RC	Result comment
SPIL	Spilled food (by animal)
TERR	Technical error
UPTD	Unable to perform due to technical difficulty
WETF	Wet or contaminated food (in container)
X	Excluded from mean/statistical analysis
-	Animal deceased, collection not scheduled to be performed or unable to calculate

Note: This is a comprehensive list of abbreviations. All of the abbreviations listed may not be applicable to this report.

Appendix 8

Dosing information

Dosing information is abbreviated on various data outputs; the following represents the dosing information for this study:

Group no.	Dose volume[a] (µL)	Total viral particle (VP)/dose	Viral particle (VP) concentration per 1 mL
1	70	0	0
2	70	3.7×10^{10}	5.3 x10^11

[a] 35 µL was administered in the thigh muscle of each hind limb on each dosing occasion (total dose volume = 0.07 mL)

Explanation page

Abbreviation	Description	Abbreviation	Description
PR	Pre-dose	4H	4 hours post-dose
HUS1	Observation following dosing		

Note: This is a comprehensive list of abbreviations. All of the abbreviations listed may not be applicable to this report.

Only animals with clinical observations on at least one occasion are presented in this appendix.

Dosing information

Dosing information is abbreviated on various data outputs; the following represents the dosing information for this study:

Group no.	Dose volume[a] (µL)	Total viral particle (VP)/dose	Viral particle (VP) concentration per 1 mL
1	70	0	0
2	70	3.7×10^{10}	5.3 x10^11

[a] 35 µL was administered in the thigh muscle of each hind limb on each dosing occasion (total dose volume = 0.07 mL)

1. INTRODUCTION

AZD1222 (ChAdOx1-nCovd-19) is under development by AstraZeneca as a potential COVID-19 disease prevention vaccine. AZD1222 is a recombinant replication-defective chimpanzee adenovirus expressing the SARS-CoV-2 Spike (S) surface glycoprotein. The objective of this study phase was to evaluate the potential effects of AZD1222 in the Irwin Screen, a behavioural, neurological and overt toxicity scoring protocol designed to detect a wide range of adverse effects.

2. EXPERIMENTAL DATES

Irwin measurement data analysis and interpretation work started:	28 October 2020
Irwin measurement data analysis and interpretation work completed:	25 November 2020

3. STUDY DESIGN

Details of groups, dose levels and numbers of animals used are given in Table 1 and Table 2.

The test or control item was administered to the appropriate animals by intramuscular injection (dose split across two dose sites) on Days 1, 22 and 43. The first day of dosing was designated as Day 1.

Table 1 Dose groups

Group No.	Animal Numbers					
	Main Study		Recovery		Immunogenicity	
	Males	Females	Males	Females	Males	Females
1	1001-1020	1501-1520	1101-1120	1601-1620	-	-
2	2001-2020	2501-2520	2101-2120	2601-2620	2201-2205	2701-2705

- = Not applicable

Appendix 10

AZD1222 Charles River Laboratories

513351 (1156PM)

Table 2 Dose levels

Group No.	Dose volume[a] (µL)	Total viral particle (VP)/dose	Viral particle (VP) concentration per 1 mL
1	70	0	0
2	70	$3.7x10^{10}$	$5.3 x10^{11}$

[a] 35 µL was administered in the thigh muscle of each hind limb on each dosing occasion (total dose volume = 70µL)

* Control (vehicle); 10 mM histidine, 7.5% (v/w) sucrose, 35 mM sodium chloride, 1 mM magnesium chloride, 0.1% (v/w) polysorbate-80, 0.1 mM EDTA and 0.5% (v/w) ethanol, pH 6.6

4. MATERIALS AND METHODS

4.1 Irwin screen observations

On Days 8 and 29, the first six males per group (main study animals) were observed in the morning and the following parameters were included in the observations:

Occurrence of vocalisation, stereotypies, aggressiveness, abnormal gait, straub tail, abducted hind limbs, tremor, twitches, convulsions, body posture, sedation, catalepsy, ptosis, exophthalmos, salivation, lacrimation, piloerection, abnormal respiration, defecation, urination and death.

Increase or decrease of spontaneous activity, touch response and body tonus. Increase of sniffing, grooming, scratching and rearing.

Decreased pinna reflex, traction response and grip strength.

Frequencies of animals exhibiting symptoms were recorded. Symptoms were scored from 0 to 3, where 0 represented no findings and 3 the highest score.

Pupil size was measured using a guidance chart to estimate the size in millimetres.

Body temperature was measured by using a probe inserted approximately 2 cm past the anal sphincter. At least 30 minutes prior to the commencement of observations, to reduce measurement variability, a temperature habituation trial was conducted by inserting the temperature probe, however, no temperature data was collected during this trial.

4.1.1 Apparatus

The traction response was measured by assessing the ability of mice to pull themselves up onto a cage top.

Grip strength was assessed by allowing mice to grip onto the cage lid. The mouse was held and allowed to grip onto the grid with all paws and then gently pulled backwards from the lid.

Appendix 10

A proforma with a size scale was used for assessing relative pupil sizes only and no exact sizes were calculated or implied.

A thermometer, with a flexible probe, was used to measure body temperature.

4.1.2 Irwin data analysis

Statistical analysis results are presented in Table 4 and Table 5.

Qualitative data
Frequencies of mice exhibiting a given symptom are reported in tabulated form. Severity scores of the observed symptoms were measured in four categories (0, 1, 2, or 3) and are presented as the dose group mean of the maximal possible score [MPS=score/max score*100] for each mouse at each time point.

As there were no positive findings noted on this study (each observation scored 0), it was not possible to run a Fisher's exact test, therefore no statistical analysis was performed on the qualitative data.

Quantitative data
All statistical tests were two-sided and performed at the 5% significance level. Where data were collected at repeated time points, each time point was analysed separately.

Pairwise comparisons were performed against the control group (Group 1). The following pairwise comparisons were performed:

Control Group v Group 2

Pupil size and body temperature was analysed using a parametric ANOVA. Pairwise comparisons were made using a Dunnett's test (equivalent to t-test in Nevis 2012 tables).

In the ANOVA summary tables, the results of the analysis have been reported indicating the level of statistical significance ($p \leq 0.05$, $p \leq 0.01$ and $p \leq 0.001$) of each pairwise comparison.

Actual p-values are not reported in the summary tables for these analyses.

4.2 Computerised systems

Table 3 Critical computerised systems

System Name	Version	Description of data collected and/or analysed
In-house reporting software Nevis (using SAS)	9.4	Applicable in-life
Share Document Management System	1.0	Reporting
DocuSign	19	Collection of CFR Part 11 compliant signature

Appendix 10

5. DEVIATIONS AND OTHER EVENTS

In error, the protocol omitted the body temperature data from statistical analysis for the Irwin Screen phase of the study. Data was scheduled to be collected, with the intention to analyse the data as is standard on this data type. As intention of the study was carried out as planned, this deviation is deemed to have had no impact on the integrity or outcome of the study.

6. RESULTS AND DISCUSSIONS

Mean data and statistical analysis of Irwin measurements data are presented in Table 4 and Table 5. Individual animal results are presented in Appendix 1 to Appendix 3.

No effect on body temperature, pupil size or any of the Irwin Screen observations were noted following administration of AZD1222.

7. CONCLUSION

The effects of AZD1222 on autonomic, neuromuscular, sensorimotor, behavioural parameters and effects on body temperature and pupil size were assessed in an Irwin Screen in conscious male mice in the morning on Day 8 and Day 29 of the 6 week intermittent dosing intramuscular vaccine toxicity study, during which male and female CD-1 mice received doses of 0 (control) or an AZD1222 viral particle dose of $3.7x10^{10}$ on Days 1, 22 and 43.

Following intramuscular administration of AZD1222 at a viral particle dose of $3.7x10^{10}$, there were no effects on body temperature, pupil size or Irwin Screen observations.

The No Observed Effect Level (NOEL) for the Irwin Screen observations, body temperature and pupil size was a viral particle dose of $3.7x10^{10}$.

Appendix 10

8. REPORT APPROVAL

This report represents a true and accurate record of the results obtained.

Analysed parameter descriptions

Parameter	Abbreviation	Units	Methodology
Red Blood Cell Distribution Width	RDW	%	Calculated
Red Blood Cell Distribution Width Gated (Wistar Rat)	RDWG	%	Calculated
Haematocrit	HCT	L/L	Calculated
Haemoglobin	HGB	g/dL	Colorimetric
Haemoglobin	HGB	g/L	Colorimetric
Mean Corpuscular Haemoglobin	MCH	pg	Calculated
Mean Corpuscular Haemoglobin Concentration	MCHC	g/dL	Calculated
Mean Corpuscular Haemoglobin Concentration	MCHC	g/L	Calculated
Mean Corpuscular Volume	MCV	fL	Calculated
Mean Platelet Volume	MPV	fL	Calculated
Platelet Count	PLT	$x10^9/L$	Light scatter
Red Blood Cell Count	RBC	$x10^{12}/L$	Light scatter
Reticulocytes	RETIC	$x10^9/L$	Calculated
Reticulocytes Percent	RETIC	%	Light scatter
White Blood Cell Count	WBC	$x10^9/L$	Light scatter
White Blood Cell Differential Count			
Neutrophils Percent	NEUT	%	Light scatter
Lymphocytes Percent	LYMPH	%	Light scatter
Monocytes Percent	MONO	%	Light scatter
Eosinophils Percent	EOS	%	Light scatter
Basophils Percent	BASO	%	Light scatter
Large Unstained Cells Percent	LUC	%	Light scatter
Neutrophils	NEUT	$x10^9/L$	Calculated
Lymphocytes	LYMPH	$x10^9/L$	Calculated
Monocytes	MONO	$x10^9/L$	Calculated
Eosinophils	EOS	$x10^9/L$	Calculated
Basophils	BASO	$x10^9/L$	Calculated
Large Unstained Cells	LUC	$x10^9/L$	Calculated
Myeloperoxidase Index	MPXI	%	Calculated staining intensity of Neutrophils relative to the archetype.
Corpuscular Hemoglobin Concentration Mean	CHCM	g/dL	Calculated
Corpuscular Hemoglobin Concentration Mean	CHCM	g/L	Calculated
Platelet Component Distribution Width	PCDW	g/dL	Calculated
Platelet Component Distribution Width	PCDW	g/L	Calculated
PCT	PCT	%	Calculated
PCT	PCT	L/L	Calculated
Platelet Distribution Width	PDW	%	Calculated
Mean Platelet Component	MPC	g/dL	Calculated
Mean Platelet Component	MPC	g/L	Calculated
Hemoglobin Concentration Distribution Width	HDW	g/dL	Calculated

Clinical pathology data flags

Abbreviation	Description
-	No sample or no result. The exception is Urine Microscopic, Red and White Blood Cell Morphology and Platelet Morphology where it denotes an abnormal finding in one or more parameter
ADQ	Adequate
AVS	Suspected aberrant value
BE0	Volume below 0.1mL
CLOT	Sample clotted
COM	Contaminated with organic material
COME	See comment value excluded
COMI	See comment value included
COMM	Comment added
DEC	Decreased
Exc	Exclude
GFC	Gross fecal contamination present
INC	Increased
INV	Invalid result
IRPS	Presence of abundant plasmodium species
ISH	Result invalid due to severe haemolysis
ISL	Result invalid due to severe lipaemia
L100	Less than 100 cells used to perform differential
LLOQ	Less than lower limit of quantification
MDIFF	Manual differential
NA	Not applicable
NAF	No abnormal findings
NC	Not calculable
NCD	No clot detected
NRBC	WBC corrected for presence of nucleated RBC
NSCH	Not scheduled to be performed
NT	Not taken
OA	Omitted activity
OOS	Sample analysed outside of established stability, results for information only
QNS	Quantity not sufficient
RSV	Refer to source values
S	Spillage
SAMU	Large number of smudge cells
SNC	Sample not collected
SNR	Sample not received
SVGS	Sample volume greater than specified
SVLS	Sample volume less than specified
TERR	Technical error (explanation required)
TNP	Test not performed
TNR	Test not reported
UNCR	Results are not reproducible
UNEX	Unscheduled data excluded from statistics

Appendix 11

Clinical pathology data flags

Abbreviation	Description
UPTD	Unable to perform due to technical difficulty
UTC	Unable to collect
UTD	Unable to determine
UTDH	Unable to determine due to marked haemolysis
UTDL	Unable to determine due to marked lipaemia
UTDM	Unable to determine results, not confirmed by microscopy
UTDR	Unable to determine results not reproducible
VARR	Assigned value above reportable range
VBRR	Assigned value below reportable range
VNC	Value not calculable
X	Excluded from mean

Note: This is a comprehensive list of clinical pathology data flags. All of the data flags listed may not be applicable to this report.

Explanation pages

Cobas 6000

Analysed parameter descriptions

Parameter	Abbreviation	Units	Methodology
3-Hydroxybutyrate	3-HB	µmol/L	Enzymatic colorimetric
5-Nucleotidase	5-NT	U/L	Enzymatic colorimetric
Alanine Aminotransferase	ALT	U/L	ALT IFCC UV
Albumin	ALB	g/L	Bromcresol green colorimetric
Albumin Rabbit	ALB	g/L	Bromcresol green colorimetric
Alkaline Phosphatase	ALP	U/L	ALP IFCC liquid colorimetric
Amylase	AMYL	U/L	Enzymatic colorimetric
Ammonia	AMM	µg/dL	Enzymatic kinetic
[1]Ammonia	AMMO	µmol/L	Enzymatic kinetic
Aspartate Aminotransferase	AST	U/L	AST IFCC UV
BAL Phospholipids (SI) mmol/L	PLIP	mmol/L	Enzymatic colorimetric
BAL Total Protein (SI) mg/L	TPROT	mg/L	Immunoturbidimetric
Bile Acids Plasma	BILEAC	µmol/L	Enzymatic colorimetric
Bicarbonate	CO2	mmol/L	PEPC enzymatic colorimetric method
Calcium	CA	mmol/L	NM-BAPTA
Chloride	CL	mmol/L	Indirect measurement (Ion selective electrode)
Cholesterol	CHOL	mmol/L	CHOD-PAP enzymatic colorimetric
C3c	C3C	mg/dL	Immunoturbidimetric
C4	C4	mg/dL	Immunoturbidimetric
Creatine Kinase	CK	U/L	CK IFCC UV
CK MB Isoenzyme	CK MB	U/L	Immunological colorimetric.
Creatinine	CREAT	µmol/L	Jaffe kinetic colorimetric. Rate-blanked and compensated
C-Reactive Protein	CRP	mg/dL	Immunoturbidimetric
[1]C-Reactive Protein	CRP	mg/L	Immunoturbidimetric
D-Dimer	DDIM	µg/mL	Immunoturbidimetric
[1]D-Dimer	DDI	mg/L	Immunoturbidimetric
Direct Bilirubin	DBIL	µmol/L	Diazo Method
Gamma-Glutamyl Transferase	GGT	U/L	Nitro-Anilide, Glycylglycine; enzymatic colorimetric
Ferritin	FERR	ng/mL	Immunoturbidimetric
[1]Ferritin	FERR	µg/L	Immunoturbidimetric
Fructosamine	FRUC	µmol/L	Colorimetric
Glucose	GLUC	mmol/L	Hexokinase UV
Glutamate Dehydrogenase	GLDH	U/L	GLDH UV
Glycosylated Haemoglobin Percent	GLY HGB	%	Turbidimetric inhibition immunoassay
Haptoglobin	HAPTO	g/L	Colorimetric
HDL Cholesterol	HDL	mmol/L	Enzymatic colorimetric
Immunoglobulin A	IGA	mg/dL	Immunoturbidimetric
[1]Immunoglobulin A	IgA	g/L	Immunoturbidimetric

Appendix 12

Cobas 6000

Analysed parameter descriptions

Immunoglobulin G	IGG	mg/dL	Immunoturbidimetric
[1]Immunoglobulin G	IgG	g/L	Immunoturbidimetric
Immunoglobulin M	IGM	mg/dL	Immunoturbidimetric
[1]Immunoglobulin M	IgM	g/L	Immunoturbidimetric
Inorganic Phosphate	PHOS	mmol/L	Molybdate -endpoint
Iron	FE	µmol/L	Colorimetric
Lactate	LACT	mmol/L	Enzymatic colorimetric
Lactate Dehydrogenase	LDH	U/L	LDH IFCC UV
LDL Cholesterol	LDL	mmol/L	Enzymatic colorimetric
Lipase	LIPASE	U/L	Enzymatic colorimetric
Magnesium	MG	mmol/L	Colorimetric endpoint method.
Non-Esterified Fatty Acids	NEFA	mmol/L	Enzymatic colorimetric
Potassium	K	mmol/L	Indirect measurement (Ion selective electrode)
Sodium	NA	mmol/L	Indirect measurement (Ion selective electrode)
Sorbitol Dehydrogenase	SDH	U/L	Enzymatic colorimetric
Total Bilirubin	TBIL	µmol/L	DPD colorimetric
Total Ketone Bodies	TOTAL KETONE BODIES	µmol/L	Cyclic enzymatic
Total Protein	TPROT	g/L	Biuret colorimetric
Transferrin	TFERRIN	g/L	Immunoturbidimetric
Triglycerides	TRIG	mmol/L	GPO-PAP enzymatic colorimetric
Unsaturated Iron Binding Capacity	UIBC	µg/dL	Colorimetric
Urea	UREA	mmol/L	Urease kinetic UV
Uric Acid	URIC ACID	µmol/L	Enzymatic colorimetric

[1]Cobas 6000 only

ADVIA Centaur

Analysed parameter descriptions

Parameter	Abbreviation	Units	Methodology
Free Triiodothyronine (pg/mL, 1 decimal)	T3FR	pg/mL	Chemiluminescence immunoassay
Free Thyroxine (ng/dL, 2 decimals)	T4FR	ng/dL	Chemiluminescence immunoassay
Triiodothyronine, Total	T3	ng/mL	Chemiluminescence immunoassay
Thyroxine ng/mL	T4	ng/mL	Chemiluminescence immunoassay

Immunoassay

Analysed parameter descriptions

Parameter	Abbreviation	Units	Methodology
50% Complement Haemolytic Activity	CH50	CH50 U Eq/mL	ELISA
Adiponectin (HMW)	ADPNCTN	ng/mL	Mouse specific ELISA
Adiponectin (SI)	ADIP (SI)	mg/L	ELISA
Aldosterone	ALDSTRN	µg/L	ELISA

Appendix 12

Immunoassay

Analysed parameter descriptions

Parameter	Abbreviation	Units	Methodology
Bb Fragment of Factor B	BB	mg/L	ELISA
Complement C3a (SI)	C3a	µg/L	ELISA
Complement C3a	C3a	ng/mL	ELISA
Complement Component C4a (SI)	C4a	µg/L	ELISA
Complement Component C4d	C4d	µg/mL	ELISA
Complement Component C4d (SI)	C4d	mg/L	ELISA
Corticosterone	CRTRONE	ng/mL	Mouse/rat specific ELISA
Corticosterone (SI)	CRTRONE	µg/L	ELISA
C-Peptide (ng/mL)	CPEPTIDE	ng/mL	Mouse specific ELISA
C-Reactive Protein	CRP	mg/L	Tridelta canine CRP ELISA
C-Reactive Protein	CRP	mg/L	Life Diagnostic rat CRP ELISA
C-Reactive Protein	CRP	mg/L	Life Diagnostic rabbit CRP
C-Reactive Protein (SI)	CRP	mg/L	ELISA
Glucagon	Glucagon	pmol/L	ELISA
Insulin ug/L	INSULI	µg/L	ELISA
Insulin-like Growth Factor-1	IGF-1	µg/L	R&D Quantakine mouse/rat specific ELISA
Myoglobin	MGB	ng/mL	ELISA
Myoglobin (SI)	MGB	µg/L	ELISA
Osteocalcin ng/mL	OSTEOCALCIN	ng/mL	Rat specific ELISA
Osteocalcin (SI)	OSTEOCALCIN	µg/L	ELISA
Renin (SI)	Ren (SI)	ng/L	ELISA
Serum Amyloid A (SI)	SAA	mg/L	ELISA
Soluble Terminal Component C5 through C9 complex	SC5b-9	ng/mL	ELISA
Complement Complex SC5b-9	SC5b-9	µg/L	ELISA
Somatotrophin;Growth Hormone	GH SOMATRO	µg/L	Demeditec mouse/rat specific ELISA
Testosterone ng/mL	TESTOS	ng/mL	ELISA
Testosterone (SI)	TESTOS	nmol/L	ELISA
Thyroid Stimulating Hormone	TSH	ng/mL	Demeditec rat specific ELISA
Thyroid Stimulating Hormone ng/mL	TSH	ng/mL	ELISA
Urine Cystatin C (SI)	CYSTATC	mg/L	ELISA
Urine Osteopontin (SI)	OPN	mg/L	ELISA

Meso Scale Discovery Sector Imager

Analysed parameter descriptions

Parameter	Abbreviation	Units	Methodology
Alpha-2 Macroglobulin	SIA2M	mg/L	Electrochemiluminescent
Alpha-1 Acid Glycoprotein SI	SIAGP	mg/L	Electrochemiluminescent
BAL Alpha-2 Macroglobin	A2M	ug/L	Electrochemiluminescent
BAL Alpha-1 Acid Glycoprotein SI	AGP	ug/L	Electrochemiluminescent

Appendix 12

i-STAT 1

Analysed parameter descriptions

Parameter	Abbreviation	Units	Methodology
Blood pH	pH		i-STAT
Bicarbonate for Blood Gas	HCO3	mmol/L	i-STAT
Partial Pressure Carbon Dioxide	PCO2	mmHg	i-STAT
Carbon Dioxide, Total	TOTAL CO2	mmol/L	i-STAT
Partial Pressure Oxygen	PO2	mmHg	i-STAT
Oxygen Saturation	O2SAT	%	i-STAT
Lactate	LACT	mmol/L	i-STAT
Base Excess	Base Excess	mmol/L	i-STAT
Ionised Calcium	ION CA	mmol/L	i-STAT
Total Hemoglobin g/dL	THGB	g/dL	i-STAT

Calculations

Parameter descriptions

Parameter	Abbreviation	Units	Methodology
Albumin/Globulin ratio	A/G	None	Albumin / Globulin
Globulin	GLOB	g/L	Total Protein – Albumin
Indirect Bilirubin	IBIL	µmol/L	Total Bilirubin – Direct Bilirubin
Total Iron binding Capacity	TIBC	µg/dL	Transferrin*22.75
[2]Total Iron binding Capacity	TIBC	µmol/L	UIBC+Iron
Urea Nitrogen	UREAN	mg/dL	Urea*2.801

[2]Calculations used in Provantis 10 only

Serum and plasma appearance (Reported as SAMQ)

Analysed Parameter Descriptions

Parameter	Abbreviation	Degree is graded as	Methodology
Normal sample	N	Normal	Manual and visual
Haemolysed sample	H	+ = mild ++ = moderate +++ = marked	Manual and visual
Lipaemic sample	L	+ = mild ++ = moderate +++ = marked	Manual and visual
Icterus sample	I	+ = mild ++ = moderate +++ = marked	Manual and visual
Atypical sample	A	Color is identified	Manual and visual

Note: This is a comprehensive list of parameters and abbreviations. All of the parameters and abbreviations listed may not be applicable to this report.

Appendix 12

Clinical pathology data flags

Abbreviation	Description
-	No sample or no result. The exception is Urine Microscopic, Red and White Blood Cell Morphology and Platelet Morphology where it denotes an abnormal finding in one or more parameters
ADQ	Adequate
AVS	Suspected aberrant value
BE0	Volume below 0.1mL
CLOT	Sample clotted
COM	Contaminated with organic material
COME	See comment value excluded
COMI	See comment value included
COMM	Comment added
DEC	Decreased
Exc	Exclude
GFC	Gross fecal contamination present
INC	Increased
INV	Invalid result
IRPS	Presence of abundant plasmodium species
ISH	Result invalid due to severe haemolysis
ISL	Result invalid due to severe lipaemia
L100	Less than 100 cells used to perform differential
LLOQ	Less than lower limit of quantification
MDIFF	Manual differential
NA	Not applicable
NAF	No abnormal findings
NC	Not calculable
NCD	No clot detected
NRBC	WBC corrected for presence of nucleated RBC
NSCH	Not scheduled to be performed
OA	Omitted activity
OOS	Sample analysed outside of established stability, results for information only
NT	Not Taken
QNS	Quantity not sufficient
RSV	Refer to source values
S	Spillage
SAMU	Large number of smudge cells
SNC	Sample not collected
SNR	Sample not received
SVGS	Sample volume greater than specified
SVLS	Sample volume less than specified
TERR	Technical error (explanation required)
TNP	Test not performed
TNR	Test not reported
UNCR	Results are not reproducible
UNEX	Unscheduled data excluded from statistics
UPTD	Unable to perform due to technical difficulty
UTC	Unable to collect

Appendix 12

Clinical pathology data flags

Abbreviation	Description
UTD	Unable to determine
UTDH	Unable to determine due to marked haemolysis
UTDL	Unable to determine due to marked lipaemia
UTDM	Unable to determine results, not confirmed by microscopy
UTDR	Unable to determine results not reproducible
VARR	Assigned value above reportable range
VBRR	Assigned value below reportable range
VNC	Value not calculable
X	Excluded from mean

Note: This is a comprehensive list of clinical pathology data flags. All of the data flags listed may not be applicable to this report.

Assigned values denoted with the data flags VARR or VBRR have been used for statistical/group mean analysis where appropriate.

Additional abbreviations

Abbreviation	Description
RC	Result comment

Location of Raw Data, Phase Related Documentation, Phase Report and Samples

This final phase report has been compiled from original raw data generated at AstraZeneca, Cambridge, UK between the experimental dates stated in Section 1. On completion of the Phase all raw data and study related documents generated during the Phase of this study, including a copy of the Phase Plan (and all associated amendments), and Final Phase Report, will be stored initially in the archives at AstraZeneca, Cambridge, UK. Periodically records

Appendix 13

2 COMPLIANCE STATEMENT

The work described in this Bioanalytical Phase of the study was conducted in compliance with the OECD Principles of GLP (ENV/MC/CHEM) (98)17 (1997), as implemented at the national level in the UK GLP Regulations, Statutory Instrument 3106 (1999), as amended by Statutory Instrument 994 (Codification Amendments Etc.) (2004).

This Bioanalytical Phase of the study was performed according to Standard Operating Procedures (SOPs) and following an approved Phase Plan.

I accept responsibility for the validity of the data generated.

I declare that the work described was performed under my supervision and that the Phase Report provides a true and accurate record of the methods used and the results obtained.

3 QUALITY ASSURANCE STATEMENT

Study Number: 513351

Study Title: AZD1222 (ChAdOx1-nCovd-19): A 6 Week Intermittent Dosing Intramuscular Vaccine Toxicity Study in the Mouse with a 4 Week Recovery

Study Phase: Immunogenicity Bioanalysis

QA has monitored this study phase and reviewed this phase report.

The phase report is considered to accurately describe the methods and procedures used in this study phase and the reported results accurately and completely reflect the raw data of the study phase.

Audits of this study phase were carried out on the following dates. Findings were reported to the Study Director, Principal Investigator and to Management.

Audit	Audit Dates	Findings reported to SD, PI and Management
Protocol Review and Amendments 1 to 8	18 Nov 2020	18 Nov 2020
Phase Plan Review	18 Nov 2020	19 Nov 2020
Protocol Review Amendments 9 and 10	25 – 26 Nov 2020	02 Dec 2020
Sample Analysis	26 Nov 2020	02 Dec 2020
Phase Report Review	01 – 02 Dec 2020	02 Dec 2020

Facilities relevant to this type of study phase are audited annually. Findings are reported to Test Site Management.

4 SUMMARY

AZD1222 is a vaccine against COVID-19 and encodes the spike protein of the SARS-CoV-2 coronavirus. The bioanalysis for the relative quantitative detection of IgG antibodies against SARS-CoV-2 spike protein in murine serum was evaluated in samples originating from Study 513351.

The inter-assay accuracy for calibration standards within limits of quantification ranged from -6.8 to 3.6% RE with precision ≤ 5.8% CV. The inter-assay accuracy for batch acceptance QC samples ranged from -19.3 to 0.3% RE with precision ≤ 15.6% CV indicating acceptable performance during the study.

Data for pre-treatment samples from all animals were negative for IgG against the SARS-CoV-2 spike protein. Following administration of AZD1222 all animals demonstrated ser-conversion with measurable levels of IgG at Day 22 sustained through Day 43 and Day 74.

6 INTRODUCTION

6.1 Bioanalytical Phase Objectives

The purpose of this bioanalytical phase was the detection of IgG antibodies against SARS-CoV-2 spike protein in murine serum samples, following administration of AZD1222 (ChAdOx1-nCovd-19) within study 513351; a 6 week intermittent dosing intramuscular vaccine toxicity study in the mouse with a 4 week recovery. The Test Facility for Study 513351 was Charles River Laboratories Edinburgh Ltd, UK. AZD1222 is under development by AstraZeneca as a potential COVID-19 vaccine.

The relative-quantitative method used in this bioanalytical phase was validated under AstraZeneca study number 2020-AZD1222-0213 with partial validation conducted under study 2020-AZD1222-0227.

This bioanalytical phase report details the relative serum concentrations of IgG against SARS-CoV-2 spike protein at predetermined timepoints during study 513351.

8 MATERIALS AND EQUIPMENT

8.1 Critical Reagents

8.1.1 Anti-SARS-CoV-2 Antibody - Calibrator

Company Code/Name:	CV191074 Murine IgG2a
Concentration:	1.17 mg/mL
Lot Number:	CV191074-003 (BET280820)
Re-test Date:	Assigned 27-Oct-2022
Storage Conditions:	Nominally -80°C
Source:	AstraZeneca Biologics Expression Team Cambridge, UK

8.1.2 SARS-CoV-2 Trimeric Spike Protein

SARS-CoV-2 Trimeric spike protein was supplied by Biopharmaceutical Development, AstraZeneca and stored in single-use aliquots in a freezer set to -80ºC.

- Batch number SP20-040, re-test date 21-May-2022

8.1.3 Detection Antibody

SULFO-TAG labelled goat anti-mouse antibody (product number: R32AC-1) was supplied by MSD (US) and stored at 2 to 8ºC. The following batch was employed in this phase:

- Batch number W0019841S, expiry date 30-Sep-2023

8.1.4 Control Biological Matrix

Pooled mouse serum was supplied by BioIVT (UK) with appropriate safety information and stored at nominally -80°C. The following batch was employed in this phase:

- Batch number MSE303394, re-test date 29-Oct-2023

8.2 Other Reagents

8.2.1 MSD 96 Well High Bind Plates

MSD 96 well high bind plates (product number: L15XB) were obtained from MSD and stored as per manufacturer's instructions at room temperature. The following batch was employed in this phase:

Appendix 13
Test Site Identifier: 2020-AZD1222-0217
Study Number: 513351

- Batch number 22JOEA, expiry date 30-Jun-2021

8.2.2 Blocker Casein in PBS (Assay Diluent)

Blocker Casein in PBS (Assay Diluent) (product number: 37528) was obtained from Thermo Fisher Scientific and stored as per manufacturer's instructions at 2 to 8ºC. The following batch was employed in this phase:

- Batch number VE301373, expiry date 09-Feb-2021

8.2.3 MSD® Gold Read Buffer B

Read Buffer B (product number: R60AM) was supplied by MSD® and stored as per manufacturer's instructions at room temperature. The following batch was employed in this phase:

- Batch number YO800010, expiry date 31-Dec-2022

9 IMMUNOGENICITY METHOD

The analytical method was validated in study 2020-AZD1222-0213 with partial validation in study 2020-AZD1222-0227.

Validation procedures followed were based upon:

- Guidance for Industry, Bioanalytical Method Validation, (CDER) May 2018
- Bioanalytical Methods Validation for Macromolecules: Summary Report reported by Krys J. Miller *et al.* (2001), *Pharm. Res*., Vol. 18, No.9, 1373-1383
- Recommendations for the Bioanalytical Method Validation of Ligand-Binding Assay to Support Pharmacokinetic Assessments of Macromolecules by DeSilva *et al.* (2003), *Pharm. Res.,* Vol. 20, No.11
- Bioanalytical Method Validation for Macromolecules Workshop/Conference Report, AAPS, 05/2006
- Guideline on Bioanalytical Method Validation (EMA), effective Feb 2012
- Fit-for-Purpose Method Development and Validation for Successful Biomarker Measurement by Lee *et al.* (2006), *Pharm. Res.*, Vol. 23, No.2

9.1 Context of Use

The purpose of the assay was to demonstrate seroconversion of animals against the SARS-CoV-2 spike protein following immunisation with AZD1222. The assay was a relative-quantitative immunoassay in murine serum performed on the MSD platform, using a monoclonal antibody against the SARS-CoV-2 spike protein as calibrator. Data from the assay were required to demonstrate exposure in the animals to the vaccine, seroconversion against the spike protein and an increase in antibody level following a boost immunisation.

9.2 Immunogenicity Analytical Procedure

For the method a sequential direct format ECL immunoassay is used. MSD high bind microtitre plates were coated with recombinant spike protein trimer from SARS-CoV-2 which captured any anti-SARS-CoV-2 immunoglobulins present in the calibrators, QC, and test samples. IgG was then detected using a SULFO-TAG-labelled goat anti-mouse antibody to form an immune complex. The complex was then detected by the addition of MSD Read Buffer to the plate and subsequent excitation of the SULFO-TAG label. The quantity of light detected correlated to the level of anti-SARS-CoV-2 IgG present in the sample.

Appendix 13

Test Site Identifier: 2020-AZD1222-0217
Study Number: 513351

A full description of the assay procedure is presented in Appendix 1.

9.3 Preparation of Reagents

The preparation of reagents necessary for the assay are included in the assay procedure in Appendix 1. Exact preparation details were recorded in the raw data.

9.4 Preparation of Calibration Standards

Anti-SARS-CoV-2 calibration standard curve was prepared in mouse serum as detailed in Table 9.4-1.

Table 9.4-1 Preparation of Calibration Standards

Spiking Solution	Volume Spike (µL)	Vol. Mouse Serum (µL)	ID	Concentration (ng/mL)**
CV191074 (1.17 mg/mL)	10	81.4	Std1	128000*
Std1	30	30	Std2	64000*

9.5 Preparation of Quality Control (QC) Samples

Validation Control samples from study 2020-AZD1222-0227 were reassigned as Quality Control samples for use in this bioanalytical phase. QC samples were assigned batch number 8223-18-070 and re-test date 08-Nov-2022. Anti-SARS-CoV-2 quality control (QC) samples were prepared by spiking the CV191074 calibrator antibody (Section 8.1.1) into mouse serum as detailed in Table 9.5-1. QC samples were aliquoted and stored in a freezer set at -80ºC.

Table 9.5-1 Preparation of Quality Controls

Spiking Solution	Volume Spike (µL)	Vol. Mouse Serum (µL)	Concentration (ng/mL)	ID
CV191074	36	1720	24000	HQC

Study Number: 513351

Table 9.5-1 Preparation of Quality Controls

Spiking Solution	Volume Spike (µL)	Vol. Mouse Serum (µL)	Concentration (ng/mL)	ID
(1.17 mg/mL)				
HQC	200	1400	3000	MQC
HQC	40	1495	625	LQC

9.6 Final Preparation of Standards, Controls and Samples

All standards, QC, and study samples were subject to a 100-fold minimum required dilution (MRD) in assay diluent (Blocker Casein in PBS) prior to analysis. Exact preparation details were documented in the raw data.

9.7 Study Sample Preparation

All study samples underwent the 100-fold MRD. Where required, samples were diluted up to a further 400-fold in 1% murine serum. Samples first underwent the 100-fold MRD with subsequent dilutions post-MRD prepared by diluting in 1% murine serum. All samples were tested in duplicate (n=2 replicates).

For all time points except Pretreatment, samples were analysed at both 50- and 400-fold dilutions as a mechanism to ensure a valid result was generated given low volume of available sample. Where both the 50-fold and 400-fold dilutions produced acceptable data the reported result was taken from the 50-fold dilution (as the lowest diluted sample).

9.8 Acceptance Criteria for Calibration Standards

For each assay a standard curve was analysed in duplicate (n=2 replicates). Standard curve precision and accuracy fulfilled the following criteria; a minimum of 75% calibration standards (minimum of 6 non-zero standards within the working range) had ≤30% CV and ≤± 30% RE. Anchor points (Standards 1 and 2 (128000 and 64000 ng/mL respectively) and Standard 11 (125 ng/mL) were not subject to these criteria.

9.9 Acceptance Criteria for Analytical Assay Runs

Acceptability criteria for all QC samples were set where frozen QC samples demonstrated a precision of ≤ 30% CV between duplicate replicates (n=2) and a measured concentration with accuracy of ±≤ 35% RE from the nominal concentration.

Accuracy (% RE) was assessed using the following equation:

% RE = [(Observed value – Nominal Concentration)/Nominal Concentration)] x 100

Precision (% CV) was determined using the equation:

Appendix 13
Test Site Identifier: 2020-AZD1222-0217
Study Number: 513351

% CV = (Std Dev of Mean Calculated Concentration/Mean Calculated Concentration) x100

Two sets of QCs were included in each analytical run. A minimum of four out of the six QC samples were required to fulfil accuracy and precision acceptance criteria as above for the run to be deemed acceptable. However, if the two failed QC samples were of the same concentration the run was classed as a failed run.

9.10 Acceptance Criteria for Immunogenicity Samples

Acceptance criteria for measurement of IgG against SARS-CoV-2 spike protein in study samples was a precision of ≤ 30% CV between duplicate replicates (n=2). Only sample data from accepted analytical assay runs were reported.

9.11 Data Processing

All data collection, processing (statistics and quantification) and storage was performed using the data reduction software package Discovery Workbench 4.0.12 or Microsoft® Excel (Office 2016). The data regression used a four parameter curve fit with $1/y^2$ weighting. All test sample concentration data were reported to 3 decimal places in AU/mL following a conversion factor of 0.001 (where AU = arbitrary units). All calibration standard and QC data were reported in ng/mL to the nearest whole number. All precision (% CV) and accuracy (% RE) data were reported to one decimal place. Minor discrepancies between the raw data and reported data are accounted for by data rounding between the Discovery Workbench Software and Microsoft® Excel.

10 STUDY SAMPLES

10.1 Sample Receipt

The following shipments were received for study 513351:

Table 10.1-1 Sample Receipt from 513351

Samples Received	Immunogenicity Sample Numbers	Date Received	Sample Condition
Pretreatment and Day 22	20	01-Oct-2020	Frozen
Day 43	10	27-Oct-2020	Frozen
Day 74	10	24-Nov-2020	Frozen

Samples were received from Charles River Laboratories, Edinburgh. All samples were stored in a freezer set to -80°C at the Test Site.

Appendix 13
Test Site Identifier: 2020-AZD1222-0217
Study Number: 513351

11 AMENDMENTS AND DEVIATIONS

11.1 Amendments

No amendments to the phase plan were issued during phase 2020-AZD1222-0217.

11.2 Deviations

No deviations to the phase plan were issued during phase 2020-AZD1222-0217.

12 IMMUNOGENICITY RESULTS

12.1 Calibration Curve and Quality Control Data

The standard curves for reported data were acceptable over the validated ranges. Data for the calibration standards were acceptable for all assays reported with full data presented in Table 16.1-1 and a representative curve presented in Section 16.2. The inter-assay accuracy for calibration standards within limits of quantification ranged from -6.8 to 3.6% RE with precision ≤ 5.8% CV.

Data for QC samples are presented in Table 16.3-1. The inter-assay accuracy for batch acceptance QC samples ranged from -19.3 to 0.3% RE with precision ≤ 15.6% CV indicating acceptable performance during the study.

12.2 Immunogenicity Sample Results

A total of 40 serum samples were analysed on 3 analytical runs. The Fate of Run Summary is presented in Table 15.1-1.

Immunogenicity data for study 513351 are presented in Table 12.2-1.

All samples were analysed in duplicate with immunogenicity results reported in AU/mL to three decimal places.

13 CONCLUSION

The bioanalysis for the relative quantitative detection of IgG antibodies against SARS-CoV-2 spike protein in murine serum was evaluated in samples originating from Study 513351.

Data for the calibration standards and QC samples through the phase met *a priori* acceptance criteria indicating reproducible performance.

Data for pre-treatment samples from all animals were negative for IgG against the SARS-CoV-2 spike protein. Following administration of AZD1222 all animals demonstrated sero-conversion with measurable levels of IgG at Day 22 sustained through Day 43 and Day 74.

14 APPENDIX 1: ASSAY PROCEDURE

14.1 Reagent Preparation

14.1.1 Preparation of Capture Reagent (SARS-CoV-2 Trimeric Spike Protein)

The capture reagent was diluted to 3.0 µg/mL in DPBS. Capture reagent was prepared immediately prior to use.

14.1.2 Preparation of Detection Reagent

The detection reagent (SULFO-TAG labelled goat anti-mouse antibody) stock was diluted to 1.0 µg/mL in assay diluent (Blocker Casein in PBS). Detection reagent was prepared immediately prior to use.

14.1.3 Preparation of 0.1% Tween 20 in PBS Wash Buffer

2 L of 0.1% Tween 20 in PBS Wash Buffer was made from 20 PBS Tablets, plus 2.0 mL Tween 20 in 2 L lab grade water (volumes were scaled as required). The expiry date was one week from date of preparation.

14.1.4 Preparation of 1% Matrix

Pooled mouse serum (100% matrix) was diluted to 1% matrix in assay diluent (Blocker Casein in PBS).

14.1.5 Preparation of Read Buffer B

MSD Gold Read Buffer B was used neat as supplied.

14.2 Preparation of Samples and Controls

All samples and controls were subject to the 100-fold MRD in assay diluent (Blocker Casein in PBS) prior to analysis.

Where required, samples underwent further dilution in 1% murine serum, as detailed in Section 9.7.

Appendix 13

14.3 Assay Procedure – Example Blank Proforma

Procedure		Performed by: Initial/date
1.	Coat MSD 96 well high bind plate with 25 µL per well of Trimer at 3 µg/mL in DPBS. Seal the plate and incubate overnight at 2-8°C.	Step 1
2.	Wash the plate 3x with 300 µL per well of Wash Buffer and blot dry. Block plate with 150 µL per well of Blocker Casein in PBS, seal the plate and incubate for at least 30 minutes on a plate shaker set at 25°C and shaking at 700 rpm. Incubation Start Time:_____ Incubation End Time:_____ Total Incubation Time:_____ Shaker ID:_____ Washer ID:	Steps 2 to 5
3.	Wash the plate 3x with 300 µL per well of Wash Buffer and blot dry. Add 50 µL per well of calibration or QC/test sample to the plate. Seal the plate and incubate on a plate shaker set at 25°C and shaking at 700 rpm for 120 ± 10 minutes. Incubation Start Time:_____ Incubation End Time:_____ Total Incubation Time:_____ Shaker ID:_____ Washer ID:_____	
4.	Wash the plate 3x with 300 µL per well of Wash Buffer and blot dry. Add 50 µL per well of Detection Reagent. Seal the plate and incubate on a plate shaker set at 25°C and shaking at 700 rpm for 60 ± 5 minutes. Incubation Start Time:_____ Incubation End Time:_____ Total Incubation Time:_____ Shaker ID: Washer ID:	
5.	Wash the plate 3x with 150 µL per well of Wash Buffer and blot dry. Add 150 µL per well of Read Buffer B and read on MSD S 600 within 10 minutes. Time Read Buffer added:_____ Time Plate Read:_____ Total Time:_____ Washer ID:_____

15 APPENDIX 2: RUN ACCEPTANCE AND SAMPLE REPEATS

15.1 2020-AZD1222-0217 Run Summary

The Fate of Run Summary performed under this bioanalytical phase report is detailed in Table 15.1-1.

Table 15.1-1 2020-AZD1222-0217 Run Summary

Run ID	Date	Assay outcome (Pass / Fail)
Run 1	25-Nov-2020	Pass
Run 2	25-Nov-2020	Pass
Run 3	26-Nov-2020	Pass

15.2 Analytical Repeats

15.2.1 Batch Repeats

All analytical runs met acceptance criteria and no run repeats were performed.

15.2.2 Sample Repeats

No individual samples required repeat during 2020-AZD1222-0217.

Individual organ weights

Explanation page

Abbreviation	Description
AVS	Aberrant value suppressed/excluded from mean/statistical calculations
Body Wt or BW	Body weight
Exc	Excluded from relative, mean/statistical calculations
LIBW	Lungs infused before weighing
MPE	Macroscopic pathology – excluded from mean/statistical calculations
MPI	Macroscopic pathology – included in mean/statistical calculations
NT	Not taken
OA	Omitted activity
ONP	Organ not present for weighing
OPOP	Only one of the paired organs present for weighing
Organ Weight (BW)	Organ weight relative to body weight
RC	Result comment
X	Excluded (applied with one of the exclusion flags)

Note: This is a comprehensive list of abbreviations. All of the abbreviations listed may not be applicable to this report.

Dosing information

Dosing information is abbreviated on various data outputs; the following represents the dosing information for this study:

Group no.	Dose volume[a] (µL)	Total viral particle (VP)/dose	Viral particle (VP) concentration per 1 mL
1	70	0	0
2	70	3.7×10^{10}	5.3 x10^11

[a] 35 µL was administered in the thigh muscle of each hind limb on each dosing occasion (total dose volume = 0.07 mL)

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1001	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, HARDERIAN : Dilatation; unilateral, focal, minimal
GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 1 : Inflammation, mononuclear cell; focal, minimal, subcutaneous tissue; myofiber
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Inflammation, mononuclear cell; focal, minimal, subcutaneous tissue; myofiber

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1002	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

BONE MARROW, STERNUM : Hematopoietic cells, increased; diffuse, mild
GLAND, SALIVARY, PAROTID : Infiltration, mononuclear cell; interstitial, focal, minimal
KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal
LIVER : Hypertrophy; centrilobular, minimal
SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SPINAL CORD : Vacuolation; neuronal, focal, minimal, ganglion; dorsal root : (Comment) lumbar section

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Histopathology - The following Tissues were Not Examined:

GLAND, MAMMARY - Not Present In Section.
GLAND, PARATHYROID - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1003	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

LUNG : Abnormal consistency : (Comment) spongy, all lobes (TGL) [LUNG : Congestion; agonal, diffuse, mild (H)]

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

HEART : Infiltration, mononuclear cell; perivascular, focal, minimal
KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal
KIDNEY : Basophilia; tubular, focal, minimal
LUNG : Congestion; agonal, diffuse, mild [LUNG : Abnormal consistency : (Comment) spongy, all lobes (G)]
SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Hemorrhage; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Inflammation, mononuclear cell; focal, minimal, subcutaneous tissue; myofiber
SPINAL CORD : Vacuolation; neuronal, focal, minimal, ganglion; dorsal root : (Comment) thoracic section
URETER : (Note) One Of A Pair Available For Evaluation.

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Histopathology - The following Tissues were Not Examined:

GLAND, MAMMARY - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1004	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
GLAND, PITUITARY : Cyst; pars distalis
LYMPH NODE, INGUINAL : (Comment) tissue sampled is adipose
SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SPINAL CORD : Vacuolation; neuronal, focal, minimal, ganglion; dorsal root : (Comment) lumbar section

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Histopathology - The following Tissues were Not Examined:

GALT - Not Present In Section.
LYMPH NODE, INGUINAL - Not Present In Wet Tissues.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1005	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal
LUNG : Aggregate; focal, minimal, macrophage : (Comment) subpleural
SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SPINAL CORD : Vacuolation; neuronal, focal, minimal, ganglion; dorsal root : (Comment) cervical, thoracic and lumbar sections

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1006	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
GLAND, THYROID : Ectopia; thymic
KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal
SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Histopathology - The following Tissues were Not Examined:

GLAND, MAMMARY - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1007	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

BRAIN : Accumulation, adipocyte; focal, minimal, choroid plexus : (Comment) 4th ventricle
KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal
SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 1 : Inflammation, mononuclear cell; focal, minimal, subcutaneous tissue; myofiber
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SPINAL CORD : (Comment) no DRG in lumbar section

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URINARY BLADDER

Histopathology - The following Tissues were Not Examined:

GLAND, MAMMARY - Not Present In Section.
URETER - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1008	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

SITE, ADMINISTRATION, 2 : Discoloration, dark : (Comment) underlying muscle, red (TGL) [SITE, ADMINISTRATION, 2 : Congestion; focal, minimal, subcutaneous tissue (H)]

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, ADRENAL : Hyperplasia; focal, minimal, subcapsular cell
GLAND, HARDERIAN : Dilatation; focal, minimal
GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
GLAND, PROSTATE : Infiltration, mononuclear cell; interstitial, focal, minimal
GLAND, SALIVARY, PAROTID : Infiltration, mononuclear cell; interstitial, focal, minimal
HEART : Infiltration, mononuclear cell; perivascular, focal, minimal
KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal
KIDNEY : Basophilia; tubular, focal, minimal
NERVE, OPTIC : (Note) One Of A Pair Available For Evaluation.
PANCREAS : Infiltration, mononuclear cell; focal, minimal, adipose tissue
SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Congestion; focal, minimal, subcutaneous tissue [SITE, ADMINISTRATION, 2 : Discoloration, dark : (Comment) underlying muscle, red (G)]
SITE, ADMINISTRATION, 2 : Inflammation, mononuclear cell; focal, minimal, subcutaneous tissue; myofiber

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SEMINAL VESICLE; GLAND, THYROID; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Histopathology - The following Tissues were Not Examined:

GLAND, MAMMARY - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1009	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, HARDERIAN : (Note) One Of A Pair Available For Evaluation.
GLAND, SALIVARY, PAROTID : Infiltration, mononuclear cell; perivascular, focal, minimal
NERVE, OPTIC : (Note) One Of A Pair Available For Evaluation.
PANCREAS : Infiltration, mononuclear cell; perivascular, focal, minimal, adipose tissue
SITE, ADMINISTRATION, 2 : Inflammation, mononuclear cell; focal, minimal, subcutaneous tissue; myofiber

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; SITE, ADMINISTRATION, 1; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Histopathology - The following Tissues were Not Examined:

GLAND, PARATHYROID - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1010	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, ADRENAL : (Note) Only Cortex And One Medulla Available For Evaluation.
GLAND, HARDERIAN : Dilatation; focal, minimal
GLAND, THYROID : (Note) One Of A Pair Available For Evaluation.
KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal
KIDNEY : Cyst; tubular, focal, minimal
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Hemorrhage; focal, minimal, subcutaneous tissue
SPINAL CORD : Vacuolation; neuronal, focal, minimal, ganglion; dorsal root : (Comment) thoracic section

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, MAMMARY; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Histopathology - The following Tissues were Not Examined:

GLAND, PARATHYROID - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1011	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

LUNG : Focus, dark : (Comment) red, few, all lobes, up to 2mm diam (TGL)
LUNG : Focus, pale : (Comment) few, all lobes, pinpoint (TGL)

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology - The following Protocol Required Tissues were Not Processed:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology - The following Protocol Required Tissues were Not Processed:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1501	Group:	1	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, ADRENAL : (Note) Only Cortex And One Medulla Available For Evaluation.
GLAND, HARDERIAN : Dilatation; focal, minimal
GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
GLAND, THYROID : (Note) One Of A Pair Available For Evaluation.
GLAND, THYROID : Cyst; focal, minimal, follicle
LYMPH NODE, MANDIBULAR : (Comment) sample is salivary gland
OVARY : (Note) One Of A Pair Available For Evaluation.
SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Inflammation, mixed cell; focal, minimal, subcutaneous tissue; myofiber
SPINAL CORD : Vacuolation; neuronal, focal, minimal, ganglion; dorsal root : (Comment) thoracic section

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; OVARY; OVIDUCT; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Histopathology - The following Tissues were Not Examined:

LYMPH NODE, MANDIBULAR - Not Present In Wet Tissues.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1502	Group:	1	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, ADRENAL : (Note) Only Cortex And One Medulla Available For Evaluation.
KIDNEY : Basophilia; tubular, focal, minimal
SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SPINAL CORD : Vacuolation; neuronal, focal, minimal, ganglion; dorsal root : (Comment) thoracic section

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; OVARY; OVIDUCT; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Histopathology - The following Tissues were Not Examined:

GLAND, PARATHYROID - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1503	Group:	1	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SPINAL CORD : Vacuolation; neuronal, focal, minimal, ganglion; dorsal root : (Comment) thoracic section

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; OVARY; OVIDUCT; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Histopathology - The following Tissues were Not Examined:

GLAND, PARATHYROID - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1504	Group:	1	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, HARDERIAN : Dilatation; focal, minimal
GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
GLAND, PITUITARY : (Comment) pars nervosa not available for examination
KIDNEY : Infiltration, mononuclear cell; perivascular, focal, minimal, pelvis
LIVER : Inflammation, mononuclear cell; focal, minimal
NERVE, SCIATIC : Infiltration, mixed cell; perineurial, focal, minimal
SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SPINAL CORD : Vacuolation; neuronal, focal, minimal, ganglion; dorsal root : (Comment) lumbar section

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; OVARY; OVIDUCT; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1505	Group:	1	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, HARDERIAN : Dilatation; focal, minimal
GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
GLAND, SALIVARY, MANDIBULAR : Infiltration, mononuclear cell; interstitial, focal, minimal
KIDNEY : Infiltration, mononuclear cell; perivascular, focal, minimal, pelvis
NERVE, SCIATIC : Infiltration, mixed cell; perineurial, focal, minimal
PANCREAS : Infiltration, mononuclear cell; focal, minimal, adipose tissue
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SPINAL CORD : Vacuolation; neuronal, focal, minimal, ganglion; dorsal root : (Comment) thoracic and lumbar sections
URETER : (Note) One Of A Pair Available For Evaluation.

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; OVARY; OVIDUCT; SITE, ADMINISTRATION, 1; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Appendix 17

Individual macroscopic and microscopic pathology

		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology - The following Protocol Required Tissues were Not Processed:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; OVARY; OVIDUCT; VAGINA; UTERUS/CERVIX

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2001	Group:	2	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, HARDERIAN : Dilatation; focal, minimal
GLAND, THYROID : (Note) One Of A Pair Available For Evaluation.
KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal
LYMPH NODE, INGUINAL : (Comment) left sample is adipose tissue
LYMPH NODE, INGUINAL : (Note) One Of A Pair Available For Evaluation.
NERVE, SCIATIC : Infiltration, mixed cell; perineurial, focal, minimal
SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 1 : Inflammation, mononuclear cell; focal, minimal, subcutaneous tissue; myofiber
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Hemorrhage; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Inflammation, mononuclear cell; focal, minimal, subcutaneous tissue; myofiber
SPINAL CORD : Vacuolation; neuronal, focal, minimal, ganglion; dorsal root : (Comment) thoracic and lumbar sections
URETER : (Note) One Of A Pair Available For Evaluation.

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE, FEMUR; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, MAMMARY; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Histopathology - The following Tissues were Not Examined:

BONE MARROW, STERNUM - Not Present In Wet Tissues.
BONE, STERNUM - Not Present In Section.
GLAND, PARATHYROID - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2002	Group:	2	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

SITE, ADMINISTRATION, 2 : Discoloration, dark : (Comment) red, muscle (TGL) [SITE, ADMINISTRATION, 2 : Hemorrhage; focal, minimal, subcutaneous tissue (H)]

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

EYE : (Comment) second eye too damaged to evaluate
EYE : (Note) One Of A Pair Available For Evaluation.
GLAND, THYROID : Ectopia; thymic
HEART : Infiltration, mononuclear cell; focal, minimal, ventricular free wall
KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal
KIDNEY : Basophilia; tubular, focal, minimal
LIVER : Infiltration, mononuclear cell; perivascular, focal, minimal
NERVE, SCIATIC : Infiltration, mixed cell; perineurial, focal, minimal
SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 1 : Inflammation, mononuclear cell; focal, minimal, subcutaneous tissue; myofiber
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Hemorrhage; focal, minimal, subcutaneous tissue [SITE, ADMINISTRATION, 2 : Discoloration, dark : (Comment) red, muscle (G)]
SITE, ADMINISTRATION, 2 : Inflammation, mononuclear cell; focal, minimal, subcutaneous tissue; myofiber

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Histopathology - The following Tissues were Not Examined:

GLAND, PARATHYROID - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2003	Group:	2	Sex:	Male

SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Inflammation, mononuclear cell; focal, minimal, subcutaneous tissue; myofiber

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2009	Group:	2	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, ADRENAL : (Note) Only Cortex Available For Evaluation.
GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
NERVE, SCIATIC : Infiltration, mononuclear cell; perineurial, focal, minimal
SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 1 : Inflammation, mononuclear cell; focal, minimal, subcutaneous tissue; myofiber
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Inflammation, mixed cell; focal, minimal, subcutaneous tissue; myofiber
SPINAL CORD : (Comment) no DRGs on lumbar section

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2010	Group:	2	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, ADRENAL : Hyperplasia; focal, minimal, subcapsular cell
GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
NERVE, SCIATIC : Infiltration, mononuclear cell; perineurial, focal, minimal
SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue

Histopathology - The following Protocol Required Tissues were Not Processed:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2501	Group:	2	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, ADRENAL : Hyperplasia; focal, minimal, subcapsular cell
GLAND, SALIVARY, MANDIBULAR : Infiltration, mononuclear cell; interstitial, focal, minimal
GLAND, THYROID : (Note) One Of A Pair Available For Evaluation.
KIDNEY : Infiltration, mononuclear cell; perivascular, focal, minimal, pelvis
NERVE, OPTIC : (Note) One Of A Pair Available For Evaluation.
NERVE, SCIATIC : Infiltration, mixed cell; perineurial, focal, minimal
SITE, ADMINISTRATION, 1 : Inflammation, mixed cell; focal, minimal, subcutaneous tissue; myofiber
SITE, ADMINISTRATION, 2 : Inflammation, mixed cell; focal, minimal, subcutaneous tissue; myofiber

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PITUITARY; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; OVARY; OVIDUCT; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Histopathology - The following Tissues were Not Examined:

GLAND, PARATHYROID - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2502	Group:	2	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

BONE MARROW, STERNUM : Hematopoietic cells, increased; diffuse, minimal
GLAND, ADRENAL : Hyperplasia; focal, minimal, subcapsular cell
GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
GLAND, THYROID : Cyst; focal, minimal, follicle
NERVE, SCIATIC : Infiltration, mixed cell; perineurial, focal, minimal
SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 1 : Inflammation, mixed cell; focal, minimal, subcutaneous tissue; myofiber
SPINAL CORD : Vacuolation; neuronal, focal, minimal, ganglion; dorsal root : (Comment) lumbar section
URETER : (Note) One Of A Pair Available For Evaluation.

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; OVARY; OVIDUCT; PANCREAS; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Animal:	2503	Group:	2	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

EYE : (Comment) second eye too damaged for evaluation
EYE : (Note) One Of A Pair Available For Evaluation.
GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
GLAND, PITUITARY : (Note) Only Distalis Available For Evaluation.
LUNG : Aggregate; focal, minimal, macrophage
LYMPH NODE, MANDIBULAR : (Comment) tissue sampled is adipose tissue
SITE, ADMINISTRATION, 1 : Hemorrhage; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 1 : Inflammation, mononuclear cell; focal, minimal, subcutaneous tissue; myofiber
SITE, ADMINISTRATION, 2 : Hemorrhage; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Inflammation, mixed cell; focal, minimal, subcutaneous tissue; myofiber
SPINAL CORD : Cyst; squamous, focal, minimal : (Comment) lumbar section

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LYMPH NODE, INGUINAL; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; OVARY; OVIDUCT; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Histopathology - The following Tissues were Not Examined:

LYMPH NODE, MANDIBULAR - Not Present In Wet Tissues.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2504	Group:	2	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

SITE, ADMINISTRATION, 2 : Discoloration, dark : (Comment) Subcutis, Red (TGL) [SITE, ADMINISTRATION, 2 : Hemorrhage; focal, minimal, subcutaneous tissue (H)]

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

BONE MARROW, STERNUM : Hematopoietic cells, increased; diffuse, minimal
GLAND, ADRENAL : (Note) Only Cortex And One Medulla Available For Evaluation.
GLAND, HARDERIAN : Dilatation; focal, minimal
GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
GLAND, PITUITARY : (Note) Only Distalis Available For Evaluation.
KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal
NERVE, SCIATIC : Infiltration, mononuclear cell; perineurial, focal, minimal
SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 1 : Inflammation, mixed cell; focal, minimal, subcutaneous tissue; myofiber
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Hemorrhage; focal, minimal, subcutaneous tissue [SITE, ADMINISTRATION, 2 : Discoloration, dark : (Comment) Subcutis, Red (G)]
SITE, ADMINISTRATION, 2 : Inflammation, mixed cell; focal, minimal, subcutaneous tissue; myofiber
URETER : (Note) One Of A Pair Available For Evaluation.

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; OVARY; OVIDUCT; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2505	Group:	2	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, THYROID : Ectopia; thymic
KIDNEY : Infiltration, mononuclear cell; perivascular, focal, minimal, pelvis
NERVE, SCIATIC : Infiltration, mixed cell; perineurial, focal, minimal
SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 1 : Inflammation, mononuclear cell; focal, minimal, subcutaneous tissue; myofiber
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Inflammation, mixed cell; focal, minimal, subcutaneous tissue; myofiber

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; OVARY; OVIDUCT; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Histopathology - The following Tissues were Not Examined:

GALLBLADDER - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2506	Group:	2	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

LYMPH NODE, INGUINAL : (Comment) second sample is mammary gland
LYMPH NODE, INGUINAL : (Note) One Of A Pair Available For Evaluation.
LYMPH NODE, INGUINAL : Cellularity, increased; lymphoid, minimal
NERVE, SCIATIC : Infiltration, mixed cell; perineurial, focal, minimal
SITE, ADMINISTRATION, 1 : Inflammation, mixed cell; focal, minimal, subcutaneous tissue; myofiber
SITE, ADMINISTRATION, 2 : Inflammation, mononuclear cell; focal, minimal, subcutaneous tissue; myofiber
URETER : (Note) One Of A Pair Available For Evaluation.

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; OVARY; OVIDUCT; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Histopathology - The following Tissues were Not Examined:

GLAND, PARATHYROID - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2507	Group:	2	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, HARDERIAN : Dilatation; focal, minimal
GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
KIDNEY : Basophilia; tubular, focal, minimal
NERVE, SCIATIC : Infiltration, mixed cell; perineurial, focal, minimal
SITE, ADMINISTRATION, 1 : Inflammation, mixed cell; focal, minimal, subcutaneous tissue; myofiber
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Inflammation, mixed cell; focal, minimal, subcutaneous tissue; myofiber
SPINAL CORD : Vacuolation; neuronal, focal, minimal, ganglion; dorsal root : (Comment) thoracic section
URETER : (Note) One Of A Pair Available For Evaluation.

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; OVARY; OVIDUCT; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2508	Group:	2	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, ADRENAL : Hyperplasia; focal, minimal, subcapsular cell
GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
NERVE, SCIATIC : Infiltration, mixed cell; perineurial, focal, minimal
SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 1 : Inflammation, mixed cell; focal, minimal, subcutaneous tissue; myofiber
SITE, ADMINISTRATION, 2 : Inflammation, mixed cell; focal, minimal, subcutaneous tissue; myofiber
SPINAL CORD : Vacuolation; neuronal, focal, minimal, ganglion; dorsal root : (Comment) thoracic and lumbar sections

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; OVARY; OVIDUCT; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2509	Group:	2	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

KIDNEY : Basophilia; tubular, focal, minimal
NERVE, SCIATIC : Infiltration, mixed cell; perineurial, focal, minimal
SITE, ADMINISTRATION, 1 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 1 : Inflammation, mixed cell; focal, minimal, subcutaneous tissue; myofiber
SITE, ADMINISTRATION, 2 : Edema; focal, minimal, subcutaneous tissue
SITE, ADMINISTRATION, 2 : Inflammation, mixed cell; focal, minimal, subcutaneous tissue; myofiber

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; OVARY; OVIDUCT; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2510	Group:	2	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

LYMPH NODE, LUMBAR : Enlargement : (Comment) bilateral, up to 5x2x2mm (TGL) [NO CORRELATE : No correlating lesion (H)]

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, ADRENAL : Hyperplasia; focal, minimal, subcapsular cell
NERVE, SCIATIC : Infiltration, mixed cell; perineurial, focal, minimal
SITE, ADMINISTRATION, 1 : Inflammation, mononuclear cell; focal, minimal, subcutaneous tissue; myofiber
SITE, ADMINISTRATION, 2 : Inflammation, mixed cell; focal, minimal, subcutaneous tissue; myofiber
NO CORRELATE : No correlating lesion [LYMPH NODE, LUMBAR : Enlargement : (Comment) bilateral, up to 5x2x2mm (G)]

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, LUMBAR; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; OVARY; OVIDUCT; PANCREAS; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Histopathology - The following Tissues were Not Examined:

GALT - Not Present In Section.
GLAND, PARATHYROID - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2511	Group:	2	Sex:	Female

		Removal Reason:	Terminal Euthanasia		
		Study Day (Week) of Death:	45 (7)		

Gross Pathology Observations [Correlation]:

LIVER : Prominent lobular architecture : (Comment) All lobes (TGL)

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology - The following Protocol Required Tissues were Not Processed:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; OVARY; OVIDUCT; VAGINA; UTERUS/CERVIX

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1618	Group:	1	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Found Dead		
		Study Day (Week) of Death:	39 (6)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GALT : (Note) Postmortem Change Present.
GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
GLAND, PITUITARY : (Comment) Sample is ganglion
KIDNEY : (Note) Postmortem Change Present.
LUNG : Congestion; agonal, diffuse, mild
LYMPH NODE, INGUINAL : (Note) Postmortem Change Present.
OVARY : (Note) Postmortem Change Present.
OVIDUCT : (Note) Postmortem Change Present.
SPINAL CORD : Vacuolation; neuronal, focal, minimal, dorsal root; ganglion : (Comment) Cervical, thoracic and lumbar sections
VAGINA : (Note) Postmortem Change Present.
UTERUS/CERVIX : (Note) Postmortem Change Present.

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; HEART; KIDNEY; LIVER; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; OVARY; OVIDUCT; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SPLEEN; THYMUS; TONGUE; VAGINA; UTERUS/CERVIX

Histopathology - The following Tissues were Not Examined:

EYE - Postmortem Change Precludes Evaluation.
GALLBLADDER - Postmortem Change Precludes Evaluation.
GLAND, PITUITARY - Not Present In Section.
GLAND, THYROID - Postmortem Change Precludes Evaluation.
LARGE INTESTINE, CECUM - Postmortem Change Precludes Evaluation.
LARGE INTESTINE, COLON - Postmortem Change Precludes Evaluation.
LARGE INTESTINE, RECTUM - Postmortem Change Precludes Evaluation.
SMALL INTESTINE, DUODENUM - Postmortem Change Precludes Evaluation.
SMALL INTESTINE, ILEUM - Postmortem Change Precludes Evaluation.
SMALL INTESTINE, JEJUNUM - Postmortem Change Precludes Evaluation.
STOMACH - Postmortem Change Precludes Evaluation.
TRACHEA - Postmortem Change Precludes Evaluation.
URETER - Postmortem Change Precludes Evaluation.
URINARY BLADDER - Postmortem Change Precludes Evaluation.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1101	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

THYMUS : Small (TGL) [THYMUS : Atrophy; mild (H)]

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, HARDERIAN : (Note) One Of A Pair Available For Evaluation.
GLAND, THYROID : Cyst; focal, minimal
KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal
LIVER : Infiltration, mononuclear cell; focal, minimal
SPINAL CORD : Vacuolation; neuronal, focal, minimal, dorsal root; ganglion : (Comment) lumbar section
THYMUS : Atrophy; mild [THYMUS : Small (G)]

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; TESTIS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1102	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, HARDERIAN : Dilatation; focal, minimal
KIDNEY : Basophilia; tubular, focal, minimal
LYMPH NODE, INGUINAL : (Comment) second sample is adipose tissue
LYMPH NODE, INGUINAL : (Note) One Of A Pair Available For Evaluation.
SPINAL CORD : Vacuolation; neuronal, focal, minimal, dorsal root; ganglion : (Comment) thoracic section

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1103	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
GLAND, THYROID : Cyst; focal, minimal
KIDNEY : Basophilia; tubular, focal, minimal
LYMPH NODE, INGUINAL : (Comment) second sample is adipose tissue
LYMPH NODE, INGUINAL : (Note) One Of A Pair Available For Evaluation.
SPINAL CORD : Vacuolation; neuronal, focal, minimal, dorsal root; ganglion : (Comment) Cervical and lumbar sections

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1104	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, THYROID : Cyst; focal, minimal
KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal
LYMPH NODE, INGUINAL : (Comment) samples are adipose tissue

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Histopathology - The following Tissues were Not Examined:

LYMPH NODE, INGUINAL - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1105	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, PITUITARY : (Note) Only Distalis Available For Evaluation.
KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal
KIDNEY : Basophilia; tubular, focal, minimal

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1106	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, ADRENAL : Hyperplasia; focal, minimal, subcapsular cell
KIDNEY : Basophilia; tubular, focal, minimal
LYMPH NODE, INGUINAL : (Comment) second sample is adipose tissue
LYMPH NODE, INGUINAL : (Note) One Of A Pair Available For Evaluation.

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Histopathology - The following Tissues were Not Examined:

GLAND, PARATHYROID - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1107	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

SPINAL CORD : Vacuolation; neuronal, focal, minimal, dorsal root; ganglion : (Comment) cervical section
TESTIS : Hypospermatogenesis; bilateral, focal, minimal

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Histopathology - The following Tissues were Not Examined:

GLAND, PARATHYROID - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1108	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul

		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
GLAND, PITUITARY : (Note) Only Distalis Available For Evaluation.
KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal
KIDNEY : Basophilia; tubular, focal, minimal
KIDNEY : Cyst; tubular, focal, minimal

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1109	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, ADRENAL : (Comment) second sample is Harderian gland
GLAND, ADRENAL : (Note) One Of A Pair Available For Evaluation.
GLAND, HARDERIAN : Dilatation; focal, minimal
GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
GLAND, SALIVARY, MANDIBULAR : Infiltration, mononuclear cell; focal, minimal
LYMPH NODE, INGUINAL : (Comment) sections are adipose and muscle

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Histopathology - The following Tissues were Not Examined:

LYMPH NODE, INGUINAL - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1110	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, ADRENAL : (Note) Only Cortex And One Medulla Available For Evaluation.
GLAND, SALIVARY, MANDIBULAR : (Comment) second sample is lymph node
GLAND, SALIVARY, MANDIBULAR : (Note) One Of A Pair Available For Evaluation.
KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal
LYMPH NODE, MANDIBULAR : (Comment) sample is adipose tissue and salivary gland
SPINAL CORD : Vacuolation; neuronal, focal, minimal, dorsal root; ganglion : (Comment) thoracic section

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Histopathology - The following Tissues were Not Examined:

GLAND, PARATHYROID - Not Present In Section.
LYMPH NODE, MANDIBULAR - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1117	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology - The following Protocol Required Tissues were Not Processed:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1118	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology - The following Protocol Required Tissues were Not Processed:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1119	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology - The following Protocol Required Tissues were Not Processed:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1120	Group:	1	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

TRACHEA : Fluid accumulation, pale : (Comment) frothy

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology - The following Protocol Required Tissues were Not Processed:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1601	Group:	1	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

LUNG : Focus, dark : (Comment) right cranial lobe, up to 2mm diameter, few, red. (TGL) [LUNG : Congestion; agonal, diffuse, minimal (H)]

Any remaining protocol required tissues, which have been examined, have no visible lesions

Gross Pathology - The following Tissues were Not Examined:

OVARY - Lost During Necropsy.

Histopathology Observations [Correlation]:

GLAND, HARDERIAN : Dilatation; focal, minimal
LIVER : Necrosis; focal, minimal
LIVER : Infiltration, mononuclear cell; focal, minimal
LUNG : Congestion; agonal, diffuse, minimal [LUNG : Focus, dark : (Comment) right cranial lobe, up to 2mm diameter, few, red. (G)]
LUNG : Aggregate; focal, minimal, macrophage
SPINAL CORD : Vacuolation; neuronal, focal, minimal, dorsal root; ganglion : (Comment) thoracic & lumbar sections

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, MAMMARY; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; OVIDUCT; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Histopathology - The following Tissues were Not Examined:

GLAND, PARATHYROID - Not Present In Section.
OVARY - Lost During Necropsy.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1602	Group:	1	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, ADRENAL : (Note) Only Distalis Available For Evaluation.
GLAND, THYROID : Ectopia; thymic
KIDNEY : Basophilia; tubular, focal, minimal
SPINAL CORD : Vacuolation; neuronal, focal, minimal, dorsal root; ganglion : (Comment) thoracic section; no DRGs in lumbar section

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; OVARY; OVIDUCT; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1603	Group:	1	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
LIVER : Infiltration, mononuclear cell; focal, minimal
LYMPH NODE, INGUINAL : (Comment) second sample is muscle
LYMPH NODE, INGUINAL : (Note) One Of A Pair Available For Evaluation.
URETER : (Comment) samples are adipose tissue

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; OVARY; OVIDUCT; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Histopathology - The following Tissues were Not Examined:

URETER - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1604	Group:	1	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, HARDERIAN : Dilatation; focal, minimal
GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal
SPINAL CORD : (Comment) no DRGs in lumbar section

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; OVARY; OVIDUCT; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1605	Group:	1	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, ADRENAL : Hyperplasia; focal, minimal, subcapsular cell

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; OVARY; OVIDUCT; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Histopathology - The following Tissues were Not Examined:

GLAND, PARATHYROID - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1606	Group:	1	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, HARDERIAN : Dilatation; focal, minimal
GLAND, HARDERIAN : Infiltration, mononuclear cell; focal, minimal
GLAND, SALIVARY, MANDIBULAR : Infiltration, mononuclear cell; focal, minimal
SPINAL CORD : Vacuolation; neuronal, focal, minimal, dorsal root; ganglion : (Comment) thoracic section

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, MAMMARY; GLAND, PITUITARY; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; OVARY; OVIDUCT; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Histopathology - The following Tissues were Not Examined:

GLAND, PARATHYROID - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, HARDERIAN : Dilatation; focal, minimal
GLAND, THYROID : Ectopia; thymic
KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal
LIVER : Infiltration, mononuclear cell; focal, minimal
SPINAL CORD : (Comment) No DRGs in thoracic section

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; OVARY; OVIDUCT; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1609	Group:	1	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
GLAND, SALIVARY, PAROTID : (Comment) samples are both mammary gland
SPINAL CORD : Vacuolation; neuronal, focal, minimal, dorsal root; ganglion : (Comment) Cervical and thoracic sections; no DRGs in lumbar section

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; OVARY; OVIDUCT; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Histopathology - The following Tissues were Not Examined:

GLAND, SALIVARY, PAROTID - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	1610	Group:	1	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, ADRENAL : (Note) Only Cortex And One Medulla Available For Evaluation.
GLAND, SALIVARY, MANDIBULAR : Infiltration, mononuclear cell; focal, minimal
GLAND, THYROID : Cyst; focal, minimal
GLAND, THYROID : Ectopia; thymic
SPINAL CORD : (Comment) No DRGs in thoracic section

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, PAROTID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; OVARY; OVIDUCT; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Individual macroscopic and microscopic pathology

513351

Animal:	1620	Group:	1	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology - The following Protocol Required Tissues were Not Processed:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; OVARY; OVIDUCT; VAGINA; UTERUS/CERVIX

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2101	Group:	2	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2102	Group:	2	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, THYROID : Cyst; focal, minimal
KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2103	Group:	2	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal
KIDNEY : Basophilia; tubular, focal, minimal
SPINAL CORD : Vacuolation; neuronal, focal, minimal, dorsal root; ganglion : (Comment) thoracic and lumbar sections

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Histopathology - The following Tissues were Not Examined:

GLAND, PARATHYROID - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2104	Group:	2	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

BRAIN : (Comment) Only one olfactory lobe
GLAND, ADRENAL : Hyperplasia; focal, minimal, subcapsular cell
KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal
SPINAL CORD : Vacuolation; neuronal, focal, minimal, dorsal root; ganglion : (Comment) thoracic and lumbar sections

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2105	Group:	2	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

LUNG : Discoloration, mottled : (Comment) all lobes (TGL) [LUNG : Congestion; agonal, diffuse, minimal (H)]

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

LUNG : Congestion; agonal, diffuse, minimal [LUNG : Discoloration, mottled : (Comment) all lobes (G)]

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2106	Group:	2	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

LUNG : Discoloration, mottled : (Comment) all lobes (TGL) [LUNG : Congestion; agonal, multifocal, minimal (H)]

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, PITUITARY : (Note) Only Distalis Available For Evaluation.
GLAND, THYROID : Cyst; focal, minimal
LUNG : Congestion; agonal, multifocal, minimal [LUNG : Discoloration, mottled : (Comment) all lobes (G)]
SPINAL CORD : (Comment) No DRGs in thoracic section; lumbar section damaged

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2107	Group:	2	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
KIDNEY : Cyst; tubular, focal, minimal

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2108	Group:	2	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, PITUITARY : (Note) Only Distalis Available For Evaluation.
GLAND, THYROID : Cyst; focal, minimal
SPINAL CORD : (Comment) No DRGs in thoracic section
TESTIS : Hypospermatogenesis; unilateral, focal, minimal

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2109	Group:	2	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, ADRENAL : Hyperplasia; focal, minimal, subcapsular cell
LYMPH NODE, MANDIBULAR : (Comment) Tissue sampled is adipose and lacrimal gland
SPINAL CORD : (Comment) No DRGs in lumbar section

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Histopathology - The following Tissues were Not Examined:

LYMPH NODE, MANDIBULAR - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

Animal:	2120	Group:	2	Sex:	Male
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology - The following Protocol Required Tissues were Not Processed:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; EPIDIDYMIS; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, PROSTATE; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, SEMINAL VESICLE; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; TESTIS; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2601	Group:	2	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, PITUITARY : (Note) Only Distalis Available For Evaluation.
SPINAL CORD : (Comment) No DRGs in cervical and thoracic sections

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; OVARY; OVIDUCT; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2602	Group:	2	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

OVARY : Cyst, dark : (Comment) red, bilateral, two, up to 7x6mm, burst at necropsy (TGL) [NO CORRELATE : No correlating lesion (H)]

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
GLAND, THYROID : Cyst; focal, minimal
KIDNEY : Infiltration, mononuclear cell; interstitial, focal, minimal
KIDNEY : Basophilia; tubular, focal, minimal
OVARY : (Comment) Cyst not present in section
SPINAL CORD : Vacuolation; neuronal, focal, minimal, dorsal root; ganglion : (Comment) no DRGs in thoracic section
NO CORRELATE : No correlating lesion [OVARY : Cyst, dark : (Comment) red, bilateral, two, up to 7x6mm, burst at necropsy (G)]

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; OVARY; OVIDUCT; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2603	Group:	2	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, HARDERIAN : Dilatation; focal, minimal
GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
GLAND, PITUITARY : (Comment) neurohypophysis not present
GLAND, THYROID : Ectopia; thymic
KIDNEY : Basophilia; tubular, focal, minimal
SPINAL CORD : Vacuolation; neuronal, focal, minimal, dorsal root; ganglion

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; HEART; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; OVARY; OVIDUCT; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Histopathology - The following Tissues were Not Examined:

URETER - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2604	Group:	2	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

OVARY : Focus, dark : (Comment) Right, few, black, pinpoint (TGL) [OVARY : Congestion; multifocal, minimal (H)]

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, PITUITARY : (Note) Only Distalis Available For Evaluation.
GLAND, THYROID : Ectopia; thymic
OVARY : Cyst; epithelial, focal, minimal
OVARY : Congestion; multifocal, minimal [OVARY : Focus, dark : (Comment) Right, few, black, pinpoint (G)]
SPINAL CORD : Vacuolation; neuronal, focal, minimal, dorsal root; ganglion : (Comment) No DRGs in cervical section

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; OVIDUCT; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2605	Group:	2	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, ADRENAL : Hyperplasia; focal, minimal, subcapsular cell
GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
LIVER : Infiltration, mononuclear cell; focal, minimal
LYMPH NODE, INGUINAL : (Comment) second sample is mammary gland
LYMPH NODE, INGUINAL : (Note) One Of A Pair Available For Evaluation.

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; GLAND, THYROID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LUNG; LYMPH NODE, INGUINAL; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; OVARY; OVIDUCT; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPINAL CORD; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Appendix 17

Individual macroscopic and microscopic pathology

513351

Animal:	2606	Group:	2	Sex:	Female
Species:	Mouse	Strain:	CD-1		
		Dose:	70 ul		
		Removal Reason:	Recovery Euthanasia		
		Study Day (Week) of Death:	74 (11)		

Gross Pathology Observations [Correlation]:

Any remaining protocol required tissues, which have been examined, have no visible lesions

Histopathology Observations [Correlation]:

GLAND, PARATHYROID : (Note) One Of A Pair Available For Evaluation.
GLAND, SALIVARY, PAROTID : (Comment) second sample is mammary gland, adipose and muscle
GLAND, SALIVARY, PAROTID : (Note) One Of A Pair Available For Evaluation.
GLAND, THYROID : Cyst; focal, minimal
GLAND, THYROID : Ectopia; thymic
LYMPH NODE, INGUINAL : (Comment) Both samples are mammary gland
SPINAL CORD : Vacuolation; neuronal, focal, minimal, dorsal root; ganglion : (Comment) cervical, thoracic and lumbar sections

Histopathology - The following Tissues were Within Normal Limits:

ARTERY, AORTA; BONE MARROW, STERNUM; BONE, FEMUR; BONE, STERNUM; BRAIN; ESOPHAGUS; EYE; GALLBLADDER; GALT; GLAND, ADRENAL; GLAND, HARDERIAN; GLAND, MAMMARY; GLAND, PARATHYROID; GLAND, PITUITARY; GLAND, SALIVARY, MANDIBULAR; GLAND, SALIVARY, PAROTID; HEART; KIDNEY; LARGE INTESTINE, CECUM; LARGE INTESTINE, COLON; LARGE INTESTINE, RECTUM; LIVER; LUNG; LYMPH NODE, MANDIBULAR; LYMPH NODE, MESENTERIC; MUSCLE, SKELETAL; NERVE, OPTIC; NERVE, SCIATIC; OVARY; OVIDUCT; PANCREAS; SITE, ADMINISTRATION, 1; SITE, ADMINISTRATION, 2; SKIN; SMALL INTESTINE, DUODENUM; SMALL INTESTINE, ILEUM; SMALL INTESTINE, JEJUNUM; SPLEEN; STOMACH; THYMUS; TONGUE; TRACHEA; URETER; URINARY BLADDER; VAGINA; UTERUS/CERVIX

Histopathology - The following Tissues were Not Examined:

LYMPH NODE, INGUINAL - Not Present In Section.

Appendix 17

Individual macroscopic and microscopic pathology

1. INTRODUCTION

This report presents the pathology findings in mice assigned to the study entitled AZD1222 (ChAdOx1-nCovd-19): A 6 Week Intermittent Dosing Intramuscular Vaccine Toxicity Study in the Mouse with a 4 Week Recovery 513351 (1156PM).

2. MATERIALS AND METHODS

All animals were submitted for necropsy on Day 45 (Terminal Euthanasia) or Day 74 (Recovery Euthanasia), except for animal F1618 which was found dead before the scheduled euthanasia date.

Tissues required for microscopic evaluation were trimmed, processed routinely, embedded in paraffin, and stained with hematoxylin and eosin (H&E).

Microscopic evaluation was conducted by the undersigned board-certified veterinary pathologist on all protocol-specified tissues from the first 10 animals/sex in Groups 1 and 2 (main study phases) and early death animals. Tissues were evaluated by light microscopy, and the results were entered directly into a validated pathology computer program (Provantis® 10, Instem) for preparation of data tables.

A small number of protocol-required tissues were not present on the slides, or were of insufficient quality to permit evaluation, even after reasonable attempts were made to obtain further sections. The reasons why they were not evaluated have been recorded in the individual animal data.

2.1 Computerized systems

Critical computerized systems used in this study phase are listed in Table 1.

Table 1 Computerized systems

System Name	Version No.	Description of Data Collected and/or Analysed

3. RESULTS

3.1 Mortality/unscheduled euthanasia

There was one unscheduled death during the course of this study (control Animal F1618). Many tissues showed post-mortem change but there were no microscopic findings that would account for the death of this animal.

3.2 Gross pathology

3.2.1 Scheduled euthanasia main study animals

No AZD1222-related gross findings were noted.

Gross findings (dark discoloration) seen at administration site 2 were considered incidental to the injection procedure and/or were of similar incidence in control and animals administered AZD1222 and, therefore, were considered to be procedural and unrelated to administration of AZD1222.

The gross finding observed in the liver of one female administered AZD1222 was of the nature commonly observed in this strain and age of mouse and, therefore, was considered unrelated to administration of AZD1222.

Gross findings are summarized in Table 2.

Table 2 Salient gross findings main study

Study phase	**Main**			
Viral Particle (VP)/dose	**0**	**3.7 x 10^{10}**	**0**	**3.7 x 10^{10}**
Sex	**Males**		**Females**	
Number of animals	**20**	**20**	**20**	**20**
Liver (No. examined)	(20)	(20)	(20)	(20)
Prominent lobular architecture	0	0	0	1
Site Admin, 2 (No. examined)	20	20	20	20
Discoloration, dark	1	2	0	1

3.2.2 Recovery animals

No AZD1222-related gross findings were noted.

All gross findings observed were of the nature commonly observed in this strain and age of mouse and, therefore, were considered unrelated to administration of AZD1222.

3.3 Organ weights

3.3.1 Main study animals

There was a test item-related higher spleen weight in both sexes, but with no correlating macroscopic or microscopic findings. Organ weight changes are summarized in Table 3.

Table 3 Salient organ weight data

Study phase	**Main**			
Sex	**Males**		**Females**	
Viral Particle (VP)/dose	**0**	**3.7 x 10^{10}**	**0**	**3.7 x 10^{10}**
Number of animals	**20**	**20**	**20**	**20**
Mean Terminal Body Weight (No. weighed)	20	20	20	20
Group mean value (g)	37.40	39.01*	29.70	30.44
Spleen (No. weighed)	(20)	(20)	(20)	(20)
Absolute value (g)	0.0910	0.1215***	0.1227	0.1738***
Relative to body weight (%)	0.24370	0.31106***	0.41039	0.56592***

Significantly different from control group 1 value Anova & Dunnett: * = $p \leq 0.05$, *** = $p \leq 0.001$.

Other differences in organs weights were considered unrelated to administration of AZD1222.

3.3.2 Recovery animals

The test item related higher weight seen in the spleens of main study animals was not present in recovery animals.

Other differences in organs weights were considered unrelated to administration of AZD1222.

Appendix 18

3.4 Histopathology

3.4.1 Main study animals

Minimal subcutaneous oedema was observed in the administration sites in male and female animals from both the control groups and those administered AZD1222 and was considered to be related to the route of administration.

Minimal mononuclear or mixed cell inflammation was observed in the subcutaneous tissue and underlying skeletal muscle at the administration sites in both male and female animals. This finding was of a higher incidence in animals administered AZD1222.

In some animals there was an extension of the inflammatory cells into the fascia and connective tissue below the skeletal muscle at the administration sites. This resulted in inflammatory cells being noted surrounding the epineurium/perineurium of the sciatic nerve samples. This finding was recorded as 'Inflammation perineurium' in the histopathology data. While sciatic epineurial/perineurial inflammatory cells were present in a small number of controls, the incidence was higher in animals administered AZD1222, and reflected the higher incidence of inflammatory cells noted at the administration sites of animals dosed AZD1222. The epineurial/perineurial inflammatory cells did not extend into the endoneurium, and no findings were present in the underlying axons, which appeared histologically normal. Inflammatory cells were not observed in the nerve roots contained within the lumbar spinal cord sections, confirming that the epineurial/perineurial inflammatory cells noted in the sciatic nerve samples resulted from an extension of the inflammation from the adjacent injection site. In the hind limb, inflammation around the sciatic nerve due to local extension from the administration site is a well-recognized effect (Sellers 2020).

Histopathology findings are summarized in Table 4.

Appendix 18

AZD1222
513351 (1156PM)

Charles River Laboratories

Table 4 Salient microscopic findings in the administration sites of main study animals

Study phase	Main			
Viral Particle (VP)/dose	**0**	**3.7 x 10^{10}**	**0**	**3.7 x 10^{10}**
Number of animals	**10**	**10**	**10**	**10**
Sex	**Males**		**Females**	
Administration site 1 (No. examined)	(10)	(10)	(10)	(10)
Inflammation, subcutaneous tissue; myofiber, minimal	2	10	1	10
Mononuclear cell	2	6	0	3
Mixed cell	0	4	1	7
Oedema, subcutaneous, minimal	8	9	7	5
Haemorrhage, subcutaneous, minimal	0	0	0	1
Administration site 2 (No. examined)	(10)	(10)	(10)	(10)
Inflammation, subcutaneous tissue; myofiber, minimal	4	10	1	9
Mononuclear cell	4	6	0	1
Mixed cell	0	4	1	8
Oedema, subcutaneous, minimal	9	9	10	4
Haemorrhage, subcutaneous, minimal	2	2	0	2
Congestion, subcutaneous, minimal	1	0	0	0
Sciatic Nerve (No. examined)	(10)	(10)	(10)	(10)
Inflammation, perineurial, minimal	0	9	2	9
Mononuclear cell	0	5	0	1
Mixed cell	0	4	2	8

The inflammation observed at the administration sites was of the nature commonly observed following intra-muscular injection of a vaccine (Greaves 2013) in this strain and age of mouse, and was considered non-adverse.

The small number of protocol-required tissues that could not be examined were spread throughout the treatment groups and therefore considered not to have impacted the quality or integrity of the study.

The remaining histopathology findings were considered unrelated to administration of AZD1222.

Appendix 18

3.4.2 Recovery animals

There were no histopathology findings considered related to the administration of AZD1222.

There were no findings in the administration sites or sciatic nerves in the Recovery animals, indicating complete recovery of the AZD1222 related inflammation.

4. DISCUSSION

Animals dosed with AZD1222 showed higher spleen weight in both sexes, but with no correlating macroscopic or microscopic findings. This spleen weight change was not present in the recovery animals. The higher incidence of inflammation at the administration sites in animals dosed with AZD1222 is consistent with that expected following the intramuscular administration of a vaccine and resulted in the extension of the inflammation into the adjacent sciatic nerve perineurium. There were no findings in the administration sites or sciatic nerve of the recovery animals showing complete recovery of the inflammation.

5. CONCLUSION

Administration of AZD1222 by intramuscular injection intermittently (on Days 1, 22 and 43) to mice was not associated with mortality or toxicity.

The minimal mixed and/or mononuclear cell inflammation in the subcutaneous tissues and skeletal muscle of the administration sites and adjacent sciatic nerve of animals dosed with AZD1222 were consistent with the anticipated findings after intra-muscular injection of vaccines, were no longer present in any of the recovery animals, and were not considered adverse.

Wednesday 23rd December-Thursday 24th December 2020

1618, 2101, 2102, 2610, 2608 – full tissue list

All group 2 animals – Brain, spinal cord, sciatic nerve, administration sites (1 and 2).

Outcome of Peer Review:
The final pathology report and tabular data represent a consensus opinion between the study pathologist and AstraZeneca review pathologist

The AstraZeneca Pathologist confirms that the relevant sections of the AstraZeneca guidance document covering peer review have been followed. The exact number of animals and tissues examined was left to the discretion of the peer review pathologist.
