You must follow the test directions carefully to get an accurate result. Each test can only be used once. This test must be used within 5 days of when you first experienced symptoms.

**IMPORTANT:** Swabbing the nostrils is critical for obtaining an accurate result. If you do not swab your nose, the device will produce a false negative result.

1. Wash your hands thoroughly for at least 20 seconds before the test.
2. Unpack the test components.
3. Remove the test cassette and place it on a flat, clean surface.
4. Locate the extraction vial and gently peel off the aluminum foil seal, being sure to keep the vial upright. The tray (available for pack sizes of 1 and 2 tests only) can assist with keeping the vial upright.
5. Locate a nasal swab and remove from the pouch. Be careful not to touch the swab tip.
6. Gently insert the swab no more than 2 centimeters (3/4 inch) into the LEFT nostril. Then, slowly rotate the swab at least 5 times in a circular path for a total of 15 seconds.
7. Gently remove the swab from the LEFT nostril and place directly into the RIGHT nostril, repeating the process of rotating at least 5 times in a circular path for a total of 15 seconds. Remove the swab from the RIGHT nostril.
8. Place the swab into the extraction vial. Rotate the swab vigorously at least 5 times.
9. Remove the swab by rotating against the extraction vial while squeezing the sides of the vial to release the liquid from the swab. Discard the swab in trash.
10. Close the vial by pushing the cap firmly onto the vial.
11. With your finger mix thoroughly by flicking the bottom of the vial.
12. Insert the extraction vial and hold the sample vertically above the sample well. Squeeze the vial gently. Allow THREE (3) drops of sample to fall into the sample well.
13. Start a timer. Do not move or lift the test cassette during this time.

**Results Interpretation**

**COVID-19 Detected (Positive)**

One red-colored line next to “C” and one blue-colored line next to “T” indicates COVID-19 positive result.

**COVID-19 Not Detected (Negative)**

One red-colored line only next to “C” indicates a negative result.

**Invalid**

If a red-colored line in the control “C” is not visible, the result is invalid.

**NOTE:** The test results should be read at 10 minutes after the sample application. The test result must be read before 15 minutes as test results after 15 minutes may not be accurate.

**IMPORTANT:** Look very closely! The color intensity in the test region will vary. Any faint colored line in the test region should be considered as positive.

A positive test result indicates that antigens from SARS-CoV-2 were detected, and you are likely to be infected and presumed to be contagious. You must immediately undergo a laboratory PCR test at a COVID-19 respiratory clinic or contact your doctor and they will arrange the test for you. COVID-19 respiratory clinics are dedicated health centres located around the country, focusing on testing people who may have COVID.

One red-colored line next to “C” and one blue-colored line next to “T” indicates COVID-19 positive result.

A negative test result indicates that antigens from SARS-CoV-2 were not detected from the specimen. However, a negative result does not rule out COVID-19. You should continue to monitor for COVID symptoms and get tested at the first sign of any symptoms.

If a red-colored line in the control “C” is not visible, the result is invalid.

Re-test with a COVID-19 test may be needed. An invalid test result indicates that your test has experienced an error and is unable to interpret the result of the test. You will need to re-test with a new test or consult a healthcare professional. If you still have symptoms, you should self-isolate at home and avoid contact with others prior to the retest.

For assistance regarding the use of the product and interpretation of test results call 1800 195 055. This service is available between 9 am and 7 pm (AEST), or 9 am and 8 pm (AEDT), 7 days per week.

**CareStart Mobile Application**

Scan the QR code for further information on how to complete the CareStart™ COVID-19 Antigen Home test.
Intended Use
CareStart® COVID-19 Antigen Home Test is intended to aid the diagnosis of COVID-19 in symptomatic patients and for the qualitative detection of SARS-CoV-2 nucleocapsid protein antigens. This test is authorised for home use in individuals:

- 11 years of age and older
- 2 – 11 who will have their test supervised by a parent or legal guardian
- who have experienced COVID symptoms within the last 5 days

The test must be used with the nasal swab provided in the kit.

Warnings and Limitations:
- Each test can only be used once
- Test results must be read at 10 minutes and no later than 15 minutes
- Interpretation of any result after 15 minutes may yield inaccurate test results
- If you receive a positive result, you must immediately seek a laboratory PCR test and follow-up care
- A positive result cannot determine whether you are infectious
- False negative results are more likely to occur if the test is performed after 5 days of symptom onset
- False negatives are more likely to occur in the later phase of infection and in asymptomatic individuals
- A negative result does not rule out infection with another type of respiratory virus. False negative results should be treated as presumptive only and may not be your infectious. If you are experiencing any COVID symptoms you must seek immediate further laboratory PCR testing and follow up clinical care.
- Repeated testing is recommended (between 24-48 hours after your first test) if there is an ongoing suspicion of infection, being in a high risk setting or where there is an occupational risk or other requirement.

DO’s
- Children between 2 – 11 years of age must be tested by a parent or legal guardian
- Wear a safety mask or other face-covering when collecting the sample from another individual
- Wash hands thoroughly for at least 20 seconds before and after handling the sample
- In order to obtain accurate results, you must follow the instructions for use
- Only open the test kit when you are ready to complete the test
- Complete the test immediately after opening the test device in the pouch
- Keep the test device on a flat surface during the testing
- Keep testing kit and kit components away from children and pets before and after use
- Do not add or mix any substances on the swab specimen may interfere with test performance and may yield a false-positive result. Avoid touching any bleeding areas or the nasal cavity when collecting specimens.
- When collecting a sample, use only the nasal swab provided in the kit
- Keep foreign substances and household cleaning products away from the test during the testing process as contact with foreign substances and household cleaning products may result in an incorrect test result
- Handle all specimens as though they contain infectious agents

DON’Ts
- Do not re-use any contents in the kit as they are single-use only
- Do not interpret the test result before 10 minutes or after 15 minutes of starting the test
- Do not use on anyone under 2 years of age
- Do not operate your test outside of the storage conditions
- Do not touch the tip (specimen collection area) of the swab
- Do not use anyone who is prone to nosebleeds or has had facial or head injury/surgery in the last 6 months.
- Do not use if the test device packaging is damaged or shows signs of being tampered with
- Do not interchange kit contents from different packs
- Do not use the kit contents beyond the expiration date
- Do not eat or drink in the area where the specimens and kit contents are being handled
- Avoid eye and skin contact with the extraction solution
- Do not ingest the extraction solution

Safety information:
Carefully wrap the used test kit components and swabs samples and dispose in normal household waste.
To help slow the spread of Covid and protect yourself and others:
- practice good hygiene (eg washing your hands, covering your coughs)
- practice physical distancing
- wearing a mask can help protect you and those around you if you are in an area with community transmission and physical distancing is not possible.
- follow the directions of your local state or territory government health department
- speak to your healthcare professional regarding other measures

Performance characteristics:

Virus tested
- Adenovirus 1
- Adenovirus 7
- Enterovirus 71, Takan/64/1998
- Human coronavirus (OC43)
- Human coronavirus (229E)
- Human metapneumovirus (MPV)
- Influenza A/Michigan/45/2015
- Influenza B/Wisconsin/07/2000
- MERScoronavirus
- Parainfluenza virus type 1
- Parainfluenza virus type 2
- Parainfluenza virus type 3
- Parainfluenza virus type 4
- Respiratory syncytial virus Type B
- Rhinovirus
- SARS-CoV-2
- Staphylococcus aureus
- Staphylococcus epidermidis
- Streptococcus pneumoniae
- Streptococcus pyogenes, Group A

Bacteria tested
- Bifidobacteria pertussis
- Candida albicans
- Chlamydia pneumoniae
- Haemophilus influenzae
- Legionella pneumophila
- Mycoplasma pneumoniae
- Staphylococcus aureus
- Staphylococcus epidermidis

To estimate the likelihood of cross-reactivity with SARS-CoV-2 of organisms that were not available for wet testing, in silico analysis was used to assess the degree of protein sequence homology.
The homology between SARS-CoV-2 nucleocapsid protein and human coronavirus hKo1 nucleocapsid protein is relatively low (35.7% across 86.4% of sequences).
Although the cross-reactivity determined in these studies was relatively low, homology-based cross-reactivity cannot be ruled out.

Analytical Sensitivity: Limit of Detection (LoD)
The LoD for direct swab was established using heat-inactivated SARS-CoV-2 isolate USA-WAl/2020 (NR-52286). The strain was spiked into the pooled human nasal swab matrix obtained from multiple healthy volunteers eluted in VTM and confirmed as SARS-CoV-2 negative by RT-PCR to prepare positive samples. The estimated LoD horizon from the initial two-fold serial dilution test was confirmed by testing 20 replicates. The confirmed LoD for direct swab was 8 x 10³ TCID₅₀/mL.

Endogenous interfering Substances Effect:
The following substances were tested with CareStart® COVID-19 Antigen Home Test and no interference was observed:

Substance (Concentration).
- Acetyl salicylic acid (15mg/mL), Bicarbonate (0.5mg/mL), Benzocaine (5mg/mL), Budenoside (2mg/mL)
- Cordycepin (2mg/mL), Desaminoadenosine (1mg/mL), Dexamethasone (6mg/mL), Diphenhydramine hydrochloride (2mg/mL), Eptifibatide hydrochloride (5mg/mL), Epinephrine (1mg/mL), Flumoxef (5mg/mL), Flumazenil (5mg/mL), Guaifenesin (40mg/mL), Hidroxicam (10mg/mL), Ivermectin (2mg/mL), Isosorbide (5mg/mL), Lactulose (5mg/mL), Lactose (5mg/mL), Levodopa (5mg/mL), Meclozine (1mg/mL), Metoclopramide (5mg/mL), Mydriatic (0.5mg/mL), Phenazopyridine (1mg/mL), Phenylephrine hydrochloride (5mg/mL), Phenylpropanolamine (5mg/mL), Tetracycline (5mg/mL), Trimethoprim (1mg/mL), Whole blood (4%), Zanamivir (1mg/mL)

In a separate study, bovine concentrations up to 1.25 µg/mL did not lead to false results, whereas, bovine concentrations >2.5 µg/mL can cause false-negative COVID-19 results.

Pack size:
CareStart® COVID-19 Antigen Home Test is available in pack sizes of 1, 2 and 20 tests. Each pack size includes a test cassette, extraction vial tube, extraction vial cap, nasal swab and user instructions. The 1 and 2 tests pack size also include a tray.

Contact information:
For assistance regarding the use of the product or for reporting any issues associated with the performance of the test call 1800 195 055. This service is available between 9 am and 7 pm (AEST), or 9 am and 8 pm (AEDT), 7 days per week.
You can also contact the Therapeutic Goods Administration (TGA) to report performance or usability issues via the online Users Medical Device Incident Report, emailing iris@tga.gov.au or calling 1800 809 361.
