For most women, having an unusual breast change is unsettling. It can bring up many different feelings and worries. It is understandable to fear breast cancer. That is why we are here to reassure you.
<table>
<thead>
<tr>
<th>Question</th>
<th>Answer</th>
</tr>
</thead>
<tbody>
<tr>
<td>I don’t have any symptoms. Do I need breast health screening?</td>
<td>Yes. Medical screening equipment aims to identify disease that might not otherwise be apparent. Many women who are diagnosed with breast cancer may not be aware of any symptoms. Breast health screening helps to reassure you when you are OK and recommend positive strategies if there is any concern.</td>
</tr>
<tr>
<td>I am too scared to have breast imaging done.</td>
<td>It is normal to experience some anxiety. Safe Breast Imaging can offer peace of mind and a procedure that is not painful. Imaging helps you to take positive action earlier. Most of us do have lumps and/or tenderness. Most of us do not get breast cancer.</td>
</tr>
<tr>
<td>Does breast imaging mean I have to have an X-ray?</td>
<td>No. Until now, breast imaging was usually done by X-ray. Safe Breast Imaging now offers you another option using the MEM, that distinguishes breast conditions.</td>
</tr>
<tr>
<td>Should I go to the BreastScreen program for a mammogram?</td>
<td>This is a good option for eligible women who are happy to have a mammogram. Safe Breast Imaging provides a choice for women who do not meet the eligibility criteria (women with dense breasts, pregnant or breastfeeding women, those under 40 years old) and for women who choose not to have a mammogram. Women with breast implants may avoid having a mammogram, so MEM is also a good choice for them.</td>
</tr>
<tr>
<td>Who is Safe Breast Imaging?</td>
<td>Safe Breast Imaging is a professional breast screening organisation committed to supporting Australian women to take responsibility for their breast health. Safe Breast Imaging offers a choice: do you take responsibility for your health by regular safe breast imaging in order to find and correct any abnormalities or postpone till you have advanced breast cancer?</td>
</tr>
<tr>
<td>What technology does Safe Breast Imaging use?</td>
<td>Safe Breast Imaging uses non-invasive and comfortable technology that measures the electrical properties of the breast tissue. Electrical conductivity differs for each type of tissue (fat, glandular, connective), age, stage of menstrual cycle and conditions in the breast (including pregnancy and breastfeeding).</td>
</tr>
<tr>
<td>What is the imaging device?</td>
<td>The MEM is a small device that sits on the breast and takes a reading through its 256 sensors. It is non-invasive and has no radiation.</td>
</tr>
<tr>
<td>Does Safe Breast Imaging support mammography?</td>
<td>Yes. Safe Breast Imaging recommends that women use all available resources to monitor their breast health status.</td>
</tr>
<tr>
<td>Can the MEM assist if I have lumps in my breasts?</td>
<td>Yes. The MEM maps the structure of the breast and differentiates lumps such as cysts, fibroadenoma, lipoma, and suspicious masses. The Safe Breast Imaging Medical Report can assist your Doctor to make an informed management decision.</td>
</tr>
<tr>
<td>Can the MEM assist if I have tenderness in my breasts?</td>
<td>Yes. Often tenderness is associated with hormonal imbalance. The MEM can give an indication of this. The Safe Breast Imaging Medical Report can assist you and your Health Practitioner to make an informed decision about what to do next.</td>
</tr>
<tr>
<td>How comfortable is the MEM Procedure?</td>
<td>Very comfortable. There is no squeezing required to obtain good images. The MEM is placed on the breast and two or more images are taken of each breast. Extra images may be required for larger breasts. Safe Breast Imaging recognises that many women want to avoid pain and radiation.</td>
</tr>
<tr>
<td>What happens after the imaging?</td>
<td>MEM screening is a medical procedure. Your images are sent to a trained doctor to interpret and provide you with result and recommendation. You receive your medical report confidentially. A copy is also sent to your doctor upon request.</td>
</tr>
<tr>
<td>Will the person taking the images tell me my results?</td>
<td>No. The Safe Breast Imaging Medical Report outlines your results with the Safe Breast Imaging doctor’s recommendations.</td>
</tr>
<tr>
<td>What if the images show something suspicious?</td>
<td>Many conditions are benign and a recommendation may be made to work with your health professional to treat these conditions. Occasionally when an area of concern shows high conductivity the doctor may recommend further assessment.</td>
</tr>
<tr>
<td>What can I do to reduce my risk of breast cancer?</td>
<td>There are many things you can do to maintain good breast health. Your health professional can assist you to reduce your risk and achieve good hormonal balance. Maintain a healthy diet and lifestyle. Undertake vigorous exercise. Do regular breast and lymph massage. Have regular safe breast screening.</td>
</tr>
<tr>
<td>May I use the Safe Breast Imaging Doctor for correcting any abnormalities found in the breast?</td>
<td>No. The Safe Breast Imaging Doctor provides you and your own health professionals with your breast health report along with recommendations to assist you in obtaining the best health care possible. Ask your doctor for an annual clinical breast examination and referral for further imaging if necessary.</td>
</tr>
<tr>
<td>How often should I have the MEM imaging done?</td>
<td>We recommend that all women be imaged once a year to maintain a history of their unique breast profile to pick up early changes. Occasionally we may suggest earlier.</td>
</tr>
<tr>
<td>When can I start having MEM imaging?</td>
<td>The MEM is safe to use from adolescence onwards. This can be of great reassurance to young women with a family history of breast cancer or personal interest in identifying early changes that may indicate possible future risk.</td>
</tr>
</tbody>
</table>
Do I still need a mammogram?

Many women do not want a mammogram, and now they have another choice with the MEM. For most women, the MEM is sufficient. It is your personal option to choose to undergo additional imaging. The MEM procedure is designed to check your breast health status. It also offers an option for women of all ages and for the large number of women who choose not to have a mammogram. On the rare occasion that we find an area of concern, a diagnostic mammogram or ultrasound will be recommended and can be useful to obtain different information.

Can I claim on my private health fund?

Many private health funds offer rebates depending on your level of cover. Check to see if yours does.

TECHNICAL INFORMATION

What does MEM stand for?

MEM stands for Multifrequency Electrical-impedance Mammograph. The MEM measures the electrical properties of the cells and differentiates tissue type: fat, glandular and fibrous.

How does the MEM work?

The MEM has 256 small sensors on a plate to map the breast structure 7 layers deep and visualise the distribution of electrical properties in the breast to identify areas with abnormal values of electrical conductivity.

Is the MEM as good as a mammogram?

The MEM and a mammogram are both valid breast imaging options. The MEM is comfortable, safe and radiation free. In addition to identifying current problems, the MEM can provide clues to your breast health years before something suspicious appears on a mammogram.

Does MEM produce an x-ray?

No. The MEM does not produce any radiation. It is also safe even for pregnant and breastfeeding women.

Is the MEM the same as infrared thermography?

No. Infrared thermography measures skin temperature and identifies metabolic activity and blood vessel patterns. Thermography requires careful thermo�raphy? environmental controls and protocols to ensure accurate images. The MEM differentiates lumps and map them, thermography does not.

How long has the MEM been available for breast health screening?

The MEM was developed about 15 years ago. It is used for breast screening in some European hospitals. It has been used in Australia for 4 years. More than 4000 Australian women have been imaged since 2005.

Who recommends the MEM?

Referring practitioners who want a safe breast imaging option for their patients recommend the MEM as a valuable diagnostic tool. A growing number of doctors and health practitioners recognise an ethical obligation to provide an option to women who cannot or do not want to have a mammogram.

My doctor has not heard of the MEM.

At this stage, many doctors do not know the benefits of the MEM because it is relatively new technology in Australia. Safe Breast Imaging can provide information to help your doctor understand the benefits of the MEM.

Is the MEM covered by Medicare?

At this stage, the imaging is not covered by Medicare. Your private health fund may provide you with a rebate.

BREAST HEALTH FACTS

Breast cancer is a disease affecting women of all ages. In Australia, 27% of women diagnosed with breast cancer are under 50.

Most women have breast concerns to some degree including lumps, pain, tenderness and discharge. Most women will not get breast cancer. Imaging can provide peace of mind.

The MEM is a first screening tool to help you decide what to do next. This may include:
- return for further imaging with Safe Breast Imaging in a shorter timeframe;
- implementing preventative health strategies with your health practitioner to reduce your risk;
- having further alternative imaging to obtain a different perspective.

Safe Breast Imaging supports YOU in maintaining good breast health

For most women, having an unusual breast change is upsetting. It can bring up many different feelings and worries. It is understandable to fear breast cancer. That is why we are here to reassure you.
Safe Breast Imaging

What we do

Safe Breast Imaging provides breast health screening for women of every age

Focus on your breast health and reduce risk

Breast cancer affects young women too.
Identifying symptoms early allows more opportunity of working with your health professional to reduce your breast cancer risk.

In Australia, 27% of those diagnosed with breast cancer are under 50. Survival rate is low.
90% of women diagnosed have NO family history of breast cancer.

The average size of a breast cancer detected on mammogram screening is 2cm
The average size of a breast cancer found before mammogram screening is 3cm
Breast cancers are picked up on a screening mammogram at about 1cm.
At this size they are already 1 billion cells and may have spread.
On average breast cancer takes 8 years before it is detected on a mammogram.

Why wait years to see if you already have breast cancer? Book now for your early check.

Safe Breast Imaging uses non-invasive electrical impedance technology for breast imaging.
The small, portable MEM device measures the electrical properties of cells as it rests on the breast.
It maps the breast structure, shows hormonal imbalance and any area that may require further investigation.

What can the MEM tell you?
If you have any symptoms of breast cancer
If you have cysts present at the time of imaging
If you have fibroadenoma
If you have a suspicious mass
If you have mastopathy (fibrocystic changes)
If you have oestrogen predominance (absolute or relative)
If you have hormonal imbalance
Why you have lumps
Why you have tenderness

"I had the imaging done with Safe Breast Imaging at my naturopath. Apart from convenient, the procedure was quick, easy, it didn't hurt and it wasn't scary. Best of all, it put my mind at ease. Now, I am working with my naturopath on reducing my risk and improving my hormonal balance."

The Australian breast screening program, BreastScreen, is targeted specifically at well women with NO symptoms aged 50-69. Over 40% of women in the target group of 50-69 years do not attend for a free mammogram regularly. Many women only go once. More than 25% of women diagnosed with breast cancer in Australia are under 50 years of age.

Safe Breast Imaging supports the government BreastScreen Program and encourages eligible women to attend, if they wish.

Safe Breast Imaging believes there is an ethical obligation to offer women of all ages another option for monitoring their breast health. Safe Breast Imaging therefore offers breast health screening for women who can not or will not have a mammogram and want another option.

**Therapeutic breast massage video.**

Now, you can learn the correct technique to do a therapeutic self breast massage and lymph drain.

It can be done in the shower, lying down or sitting comfortably.

- **Benefits:**
  - Increases oxygen into breast tissue,
  - gentle technique to aid fluid recirculation,
  - drains toxins out,
  - unbinds tight spots,
  - helps in dissolving fluid-like cysts,
  - relieves tightness in chest muscles,
  - reduces pain, congestion, and swelling related to PMS,
  - strengthens and adds resiliency to breast tissue,
  - promotes lymphatic drainage,
  - provides relaxation,
  - enhances circulation of blood and lymph in the area,
  - enhances the health and elasticity of the support ligaments, which in turn provides better breast support.

For your own electronic therapeutic self breast massage instruction video, click on the link below. This will take you to a secure website where you can purchase the video for $AU10.00. You can then access the video and enjoy the many benefits of self massage any time.

Safe Breast Imaging

Introduction

X-Ray mammography is currently the standard imaging modality for detection of breast cancer. As well as sending a radiation dose through the breast, the x-ray mammography procedure is often uncomfortable and/or painful for many women. The process involves flattening the breast against a screen in order to obtain suitable radiograph images. Exposure to the x-ray ionizing radiation can ultimately damage breast tissue, particularly through cumulative effects. In addition x-ray mammography has a relatively high percentage of misdiagnoses and false detections resulting in either missed cancers or unnecessary biopsies, surgery, chemotherapy and/or radiotherapy treatment.

Recently, the Multifrequency Electrical Impedance Mammography (MEM) using electrical impedance tomography has been developed by the Institute of Radiotechnology and Electronics of the Russian Academy of Science for non-invasive detection of signs of breast pathology including breast cancer. The MEM imaging procedure is suitable for all ages, comfortable for the patient, and provides both anatomical and physiological information. The MEM poses no safety hazards to either the patient or the clinician, and results have been found to be positive in detecting pre-cancer pathology, as well as early signs of cancer and early stage small tumours.

The technology behind the MEM involves an array of 256 electrodes placed on the breast with a single electrode placed on the patient’s opposite wrist. The electrodes in the array are driven sequentially with a predetermined electrical frequency while the resulting current through each electrode is measured. This results in a conductivity contour map of the breast.

The MEM provides images of electroconductivity distribution of biological tissue through the breast, thus defining any areas with abnormal values of electroconductivity. Every organ of the human body has its own electrical characteristics. These characteristics are determined by electrical properties of the tissue, which form and surround the organs, as well as by the properties of intravascular and extravascular fluid.

Resulting images derived from the MEM demonstrate relatively low conductivity regions for solid tissue such as adipose tissue, and higher conductivity regions for glandular tissue. The MEM makes it possible to visualise distribution of electroconductivity in transverse sections. It is a well established fact that many malignant tumors are characterised by electroconductivity which significantly differ from that of surrounding healthy tissue. The MEM demonstrates a difference in conductivity for cancerous tissue compared with normal tissue, thereby providing a contrast ratio in the resulting conductivity map derived from the signals received from the array of electrodes. In this way, signs of cancer can be determined from the conductivity map image.

The MEM is also useful in differentiating benign from malignant problems, such as cysts, fibroadenoma, etc. Within the breast, different tissue has different conductivity, from low eg. Fat, muscle, dividing structure, breast tissue, fibroadenoma, cyst, blood, cancer, high oestrogen. (This is low to high conductivity).

The MEM is capable of providing both anatomical and physiological information. Physiological changes often precede anatomical changes that can be detected by palpation and mammography.

Anatomy - by mapping 7 layers of the breast, each 7mm apart, the anatomical structure is viewed to differentiate the structure of the breast.

Physiology - The MEM system shows a difference in conductivity for cancerous tissue compared with normal tissue. In this way, signs of cancer can be determined from the conductivity image.

The probability value for MEM is the probability of malignancy. P>0.5 should be considered as a signal for more detailed investigation. Conductivity of 0.95 or higher (other than artefacts) may indicate malignant pathology in the breast.
IMPORTANT: While it provides information which may assist a practitioner in patient management decisions, the MEM does not provide a final diagnosis for breast cancer.

Benefits of the MEM
- Suitable for all ages
- Non-invasive
- No radiation
- Anatomical and physiological information
- Pre-clinical evidence of possible risk
- Able to image women with augmentation (implants)
- Able to frequently monitor high risk patients
- Portable – can be done on-site in communities, work place, Expos, Shopping Centres, Airports, anywhere
- Increases number of women having breast screening beyond mammography program.

Limitations of Mammography
In some countries, mammography is viewed as the "gold standard" of breast screening. Mammography is not suited to many women, however, so these women may benefit from the MEM. The MEM is not in competition to the mammogram. Mammograms have limitations including:
- Not suited to pre-menopausal breast tissue
- Not suited for dense breast tissue
- Not suited to women on hormone replacement therapy (increases density)
- Not suited to young women
- Not suited to pregnant women
- Not suited for breastfeeding women
- Not suited for frequent imaging for women of high risk. (Recommendation 2-yearly)
- Radiation is an invasive form of imaging that can damage tissue
- Compression can cause damage to breast tissue
- Some women refuse to have a mammogram.

At Safe Breast Imaging we know that your time is important.

That is why we come to a clinic near you.

"I was so fearful that I had cancer. I was encouraged by my neighbour to have an alternative breast check as she was so grateful to have seen you. Although different to the Mammogram I was happy to have been introduced to a new experience and most of all a more civil approach. I remember leaving your consultation feeling reassured and eager to tell many others of my experience and peace of mind.
